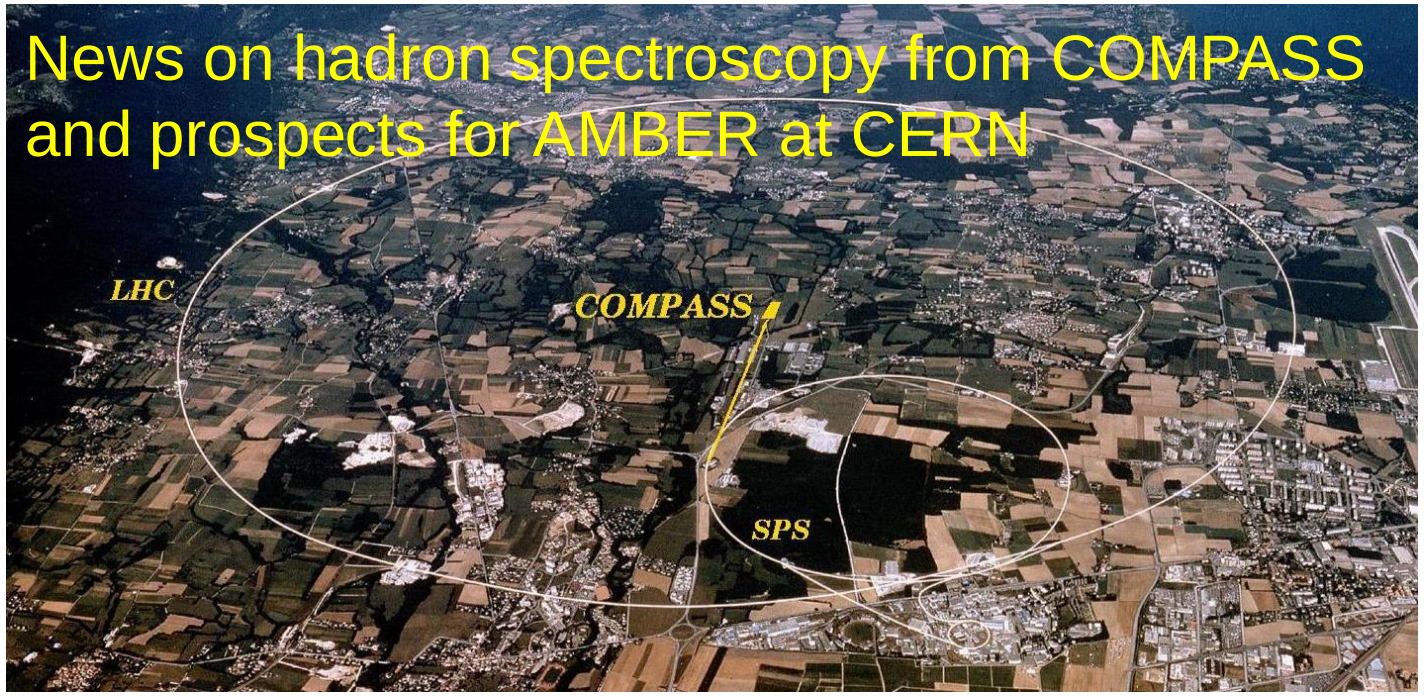
News on hadron spectroscopy from COMPASS and prospects for AMBER at CERN

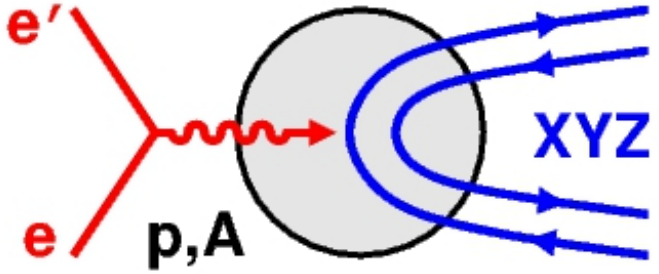


Jan Friedrich

Technische Universität München

14 April 2025

on behalf of the COMPASS and AMBER Collaborations

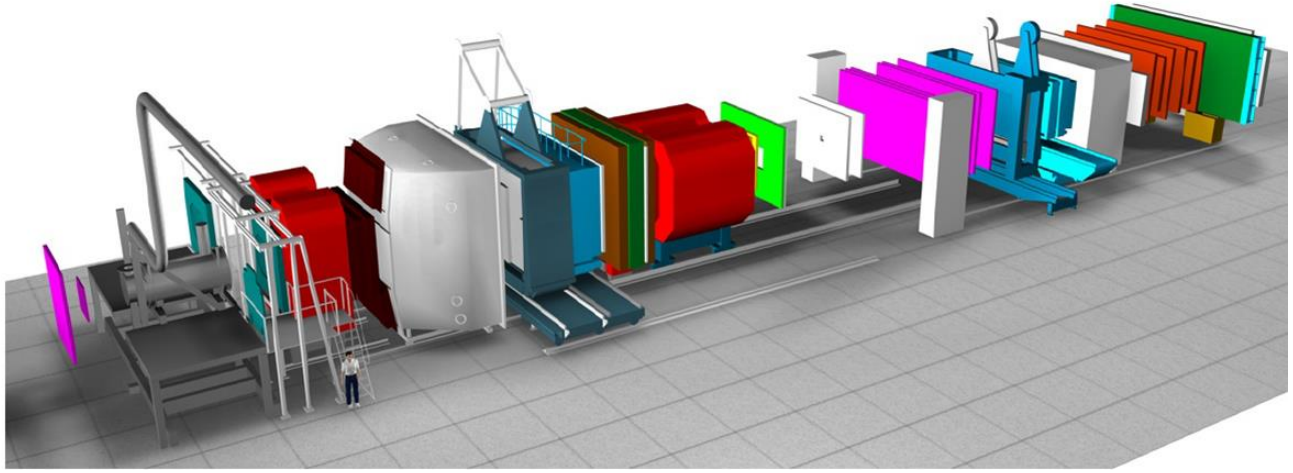


Exotic heavy meson spectroscopy and structure with EIC: Next-level physics and detector simulations

14.–17. Apr. 2025
CFNS, Stony Brook University

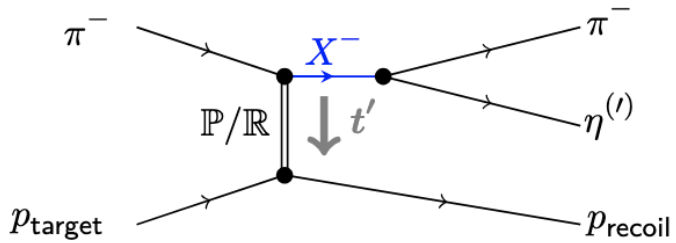
News on hadron spectroscopy from COMPASS

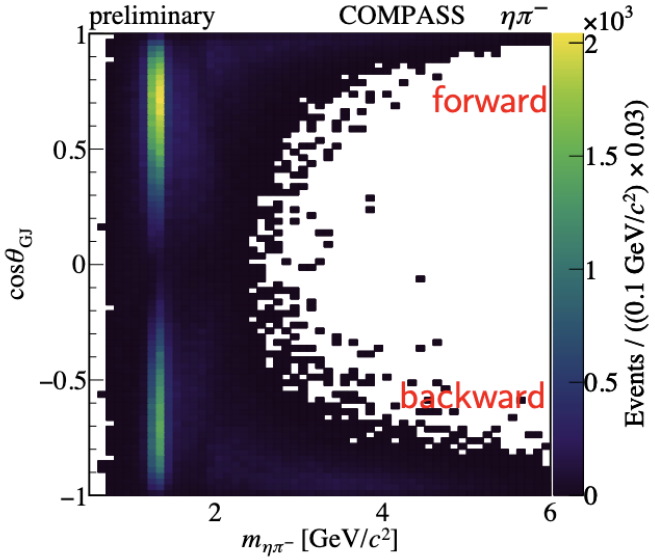
- COMPASS now in analysis phase
- many analyses on the different physics fields intensively pursued
- analysis of $\pi^- p \to \pi^- \eta^{(\prime)} p$ in double-Reggeon approach (H. Pekeler, U Bonn)
- analysis of diffractively produced $\omega\pi^-\pi^0$ and $K_S^0 K^-$ final states (F. Haas, J. Beckers, TUM)
- news on the spin-exotic $\pi_1(1600)$

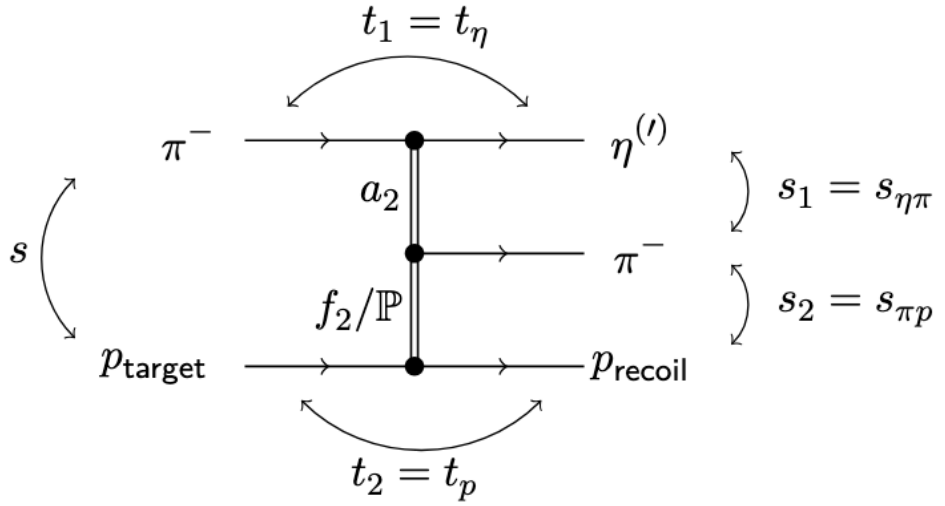


- Not covered in this talk (cf. talk of Boris Grube on the previous 2022 workshop, https://indico.bnl.gov/event/14792):
- (non) observation of $Z_c^{\pm}(3900)$ and $Z_c^{\pm}(4200)$ in exclusive muoproduction [COMPASS, PLB 742 (2015) 330; Wang, Chen, Guskov, PRD 92 (2015) 094017]
- Observation of muoproduced $X(3872)$ in $J/\psi\pi^+\pi^-\pi^\pm$ final states [COMPASS, PLB 783 (2018)], eventually $\tilde{X}(3872)$ as a $C = -1$ partner of $X(3872)$

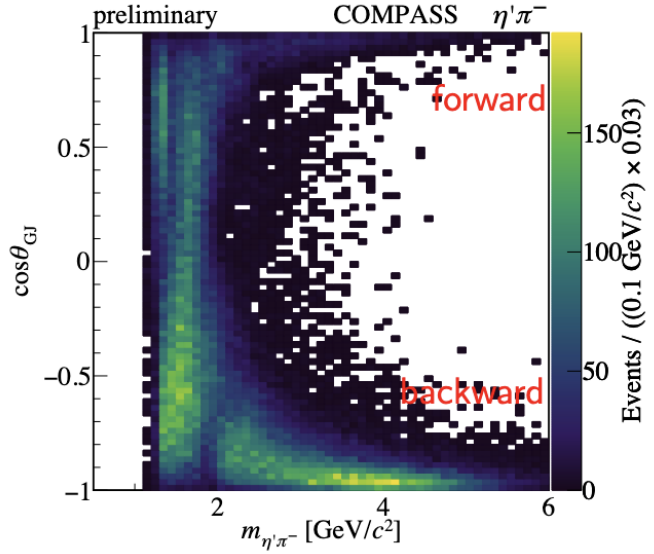
Further analysis of $\pi^- p \to \pi^- \eta^{(\prime)} p$





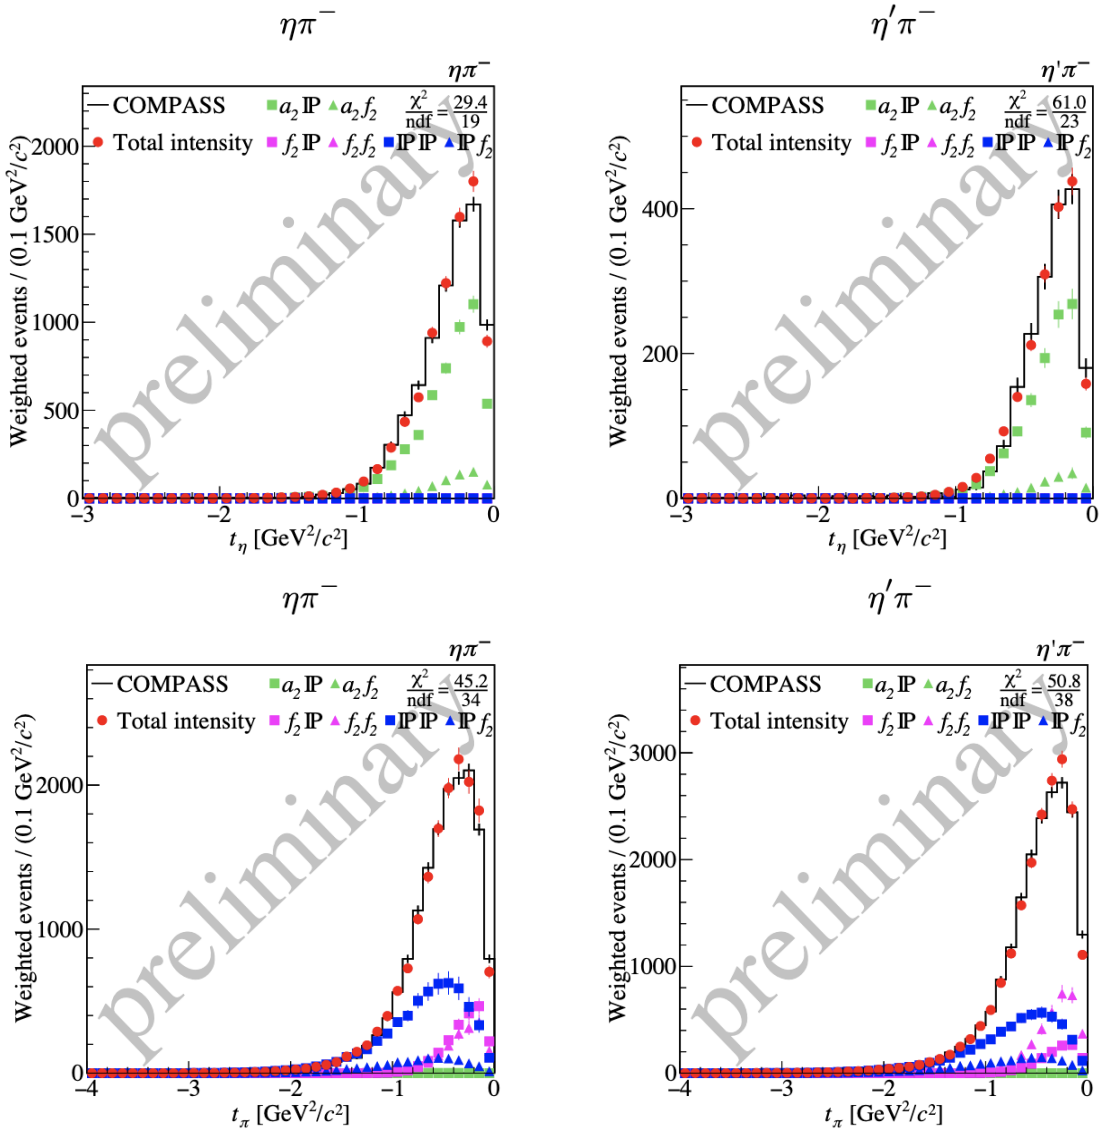


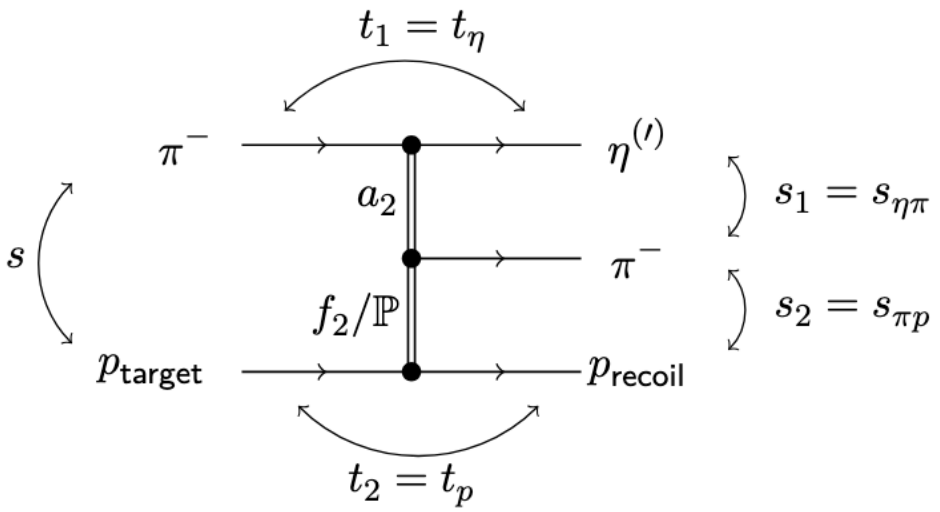
- COMPASS 2008/09 data have been largely interpreted in terms of intermediate X^- resonances
- Forward/backward peaks at larger $m_{\pi\eta^{(\prime)}}$ driven by double-Reggeon exchange



- Analysis in cooperation with JPAC (associated members of COMPASS)

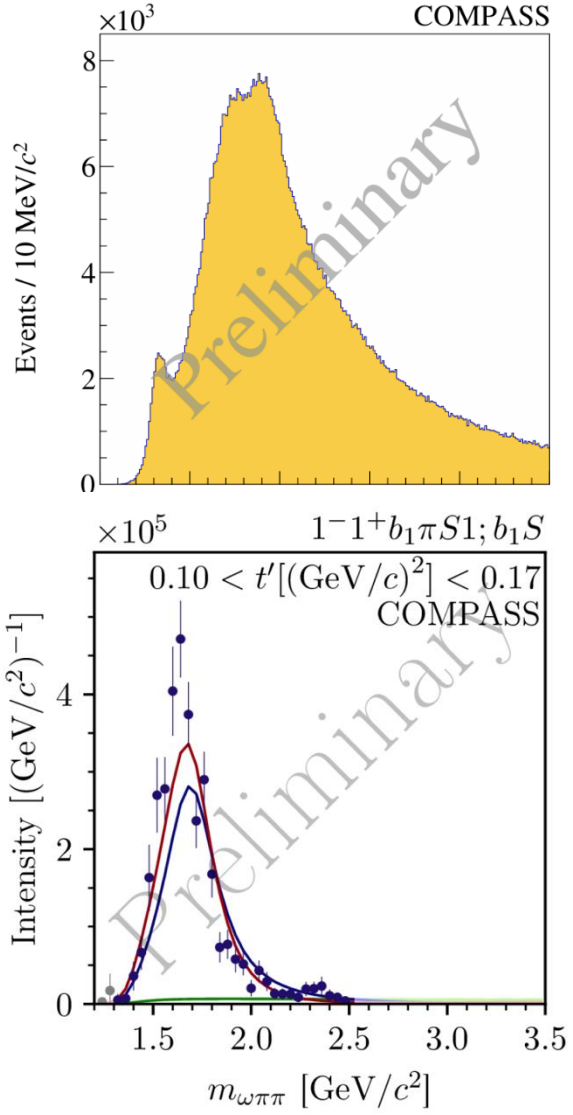
Further analysis of $\pi^- p \to \pi^- \eta^{(\prime)} p$

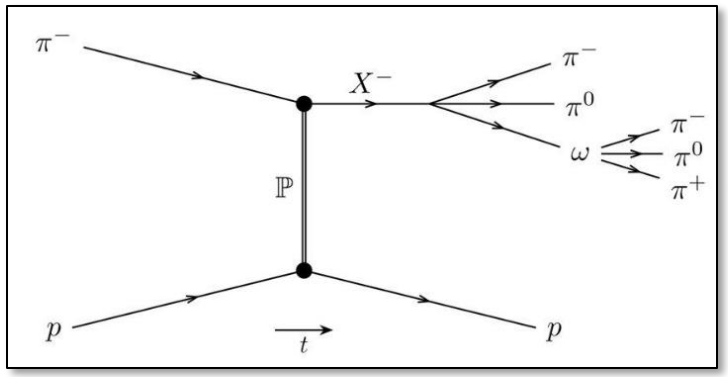


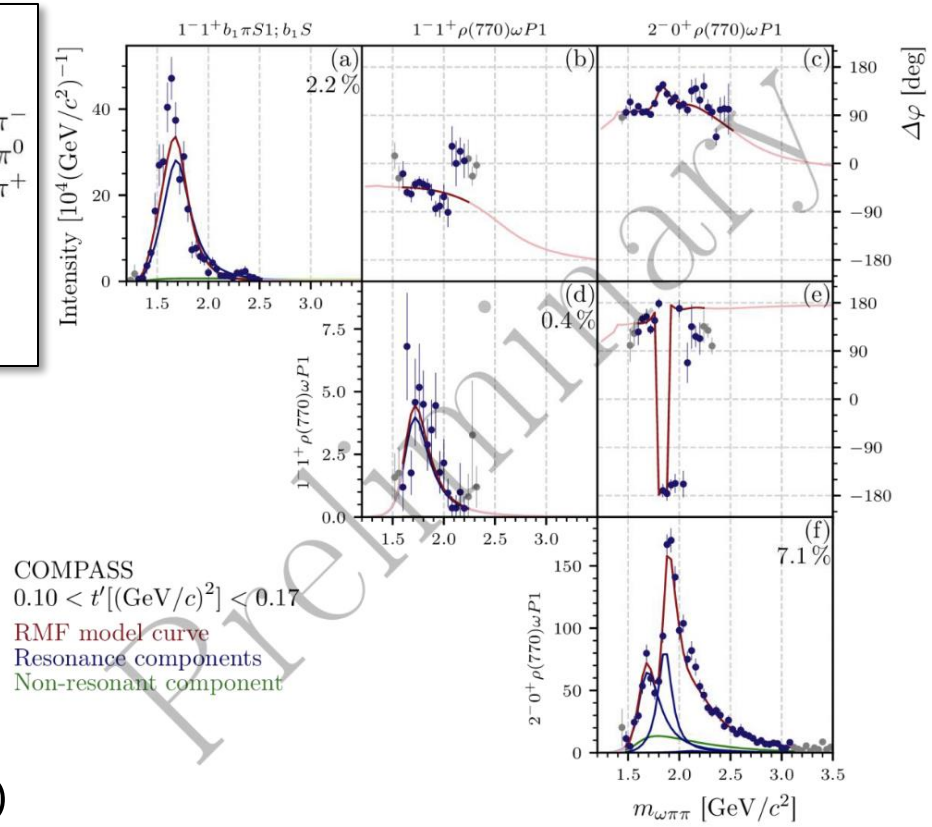


- Amplitude ansatz: $e^{b_{i1} t_1} e^{b_{i2} t_2}\ \mathbf{T}$
  $\mathbf{T}$ from Shimada et al., Nucl. Phys. B 142 (1978)
- Forward: Pomeron/a_2 dominated
- Backward: significant f_2 contribution
- Global fit with 13 parameters sufficient for a good description of our data

Resonance model fit of $\omega\pi^-\pi^0$







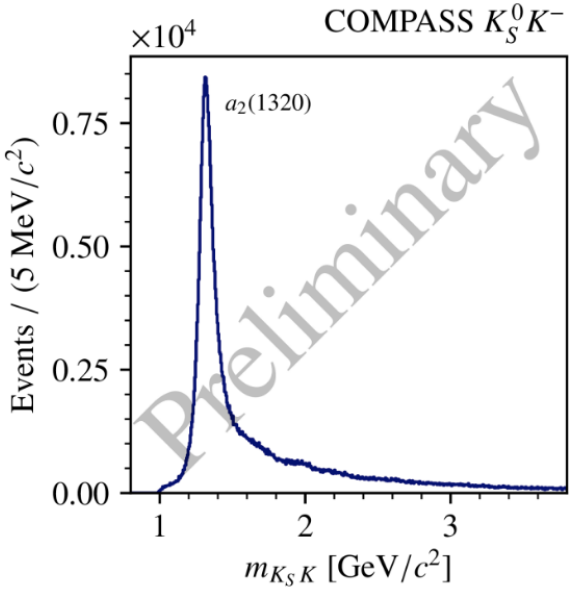
- Clear $\boldsymbol{\pi_1(1600)}$ signal

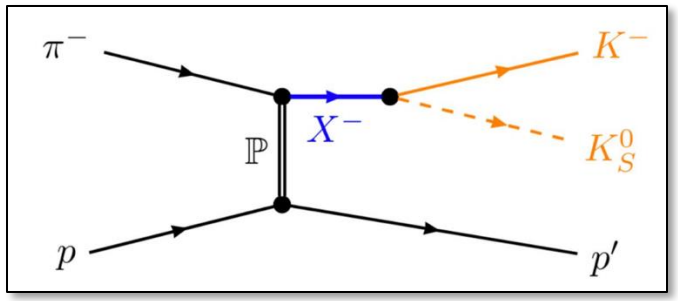
$$m_0 = 1723 \pm 6\ ^{+37}_{-14}\ \mathrm{MeV}/c^2$$
$$\Gamma_0 = 336 \pm 10\ ^{+96}_{-33}\ \mathrm{MeV}/c^2$$

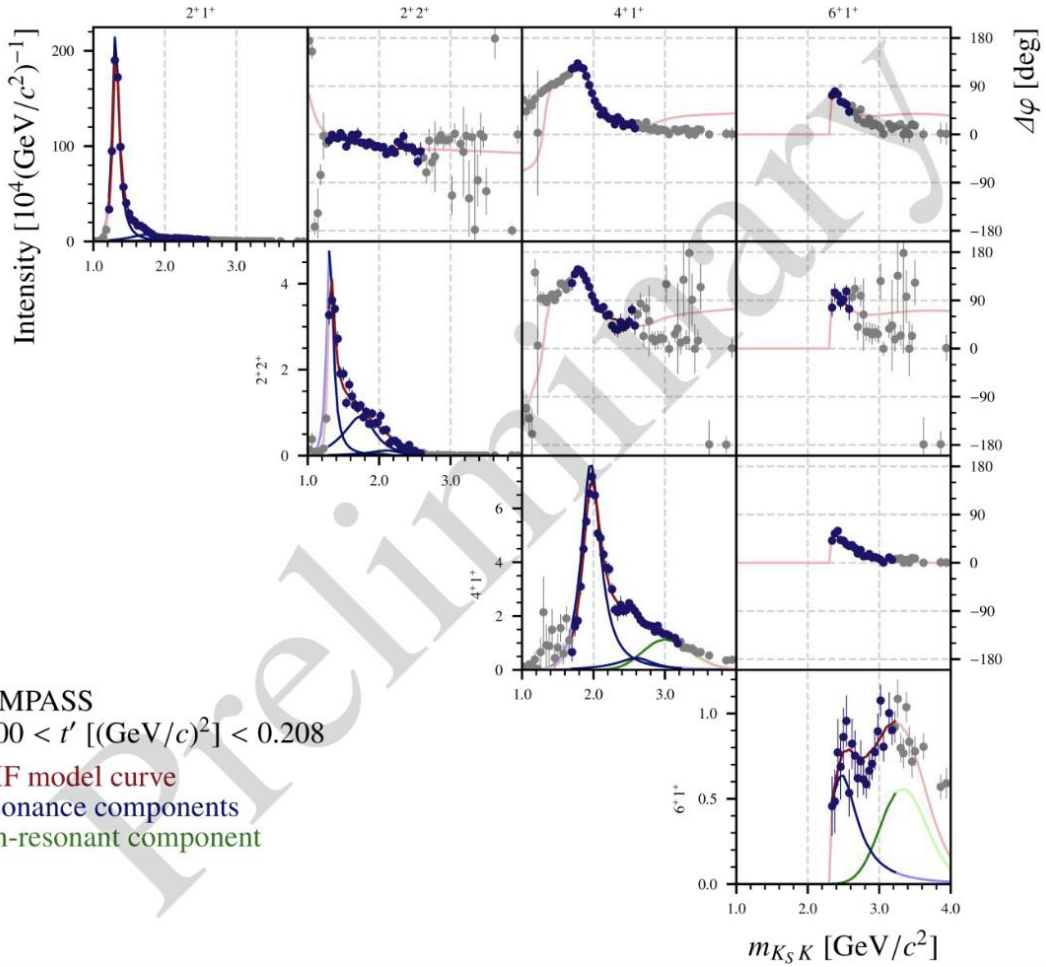
- No indication for $\pi_1(2015)$ as claimed by BNL E852

- dominant decay into $b_1\pi$ (as predicted)
- also seen in $\omega\rho$: first observation

Partial-wave analysis of $K_S^0 K^-$

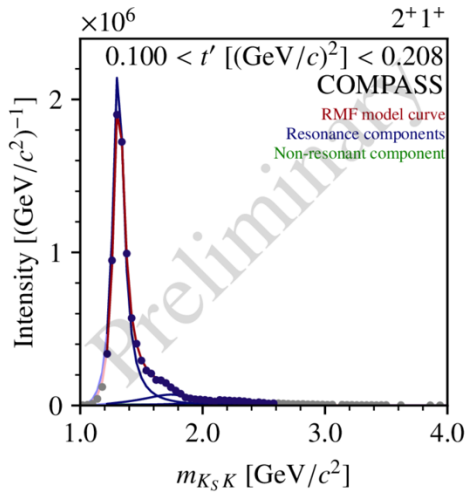


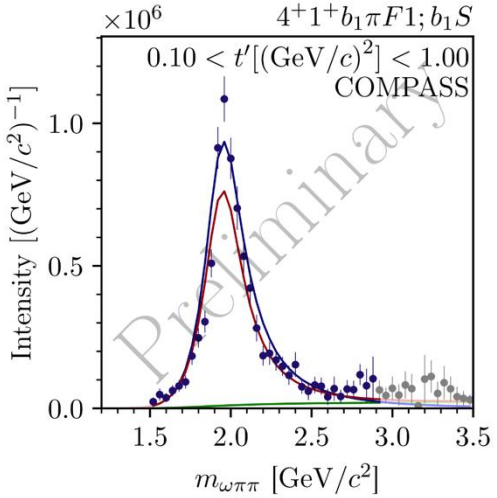


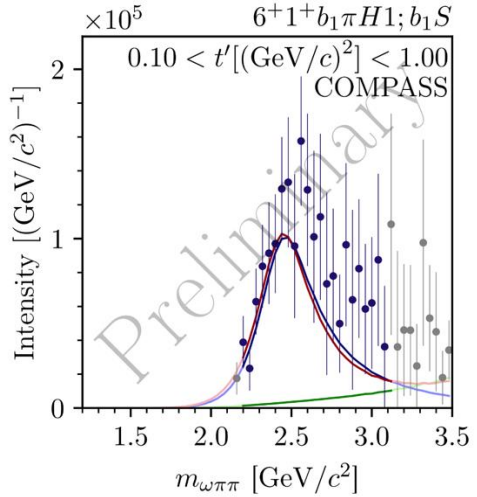


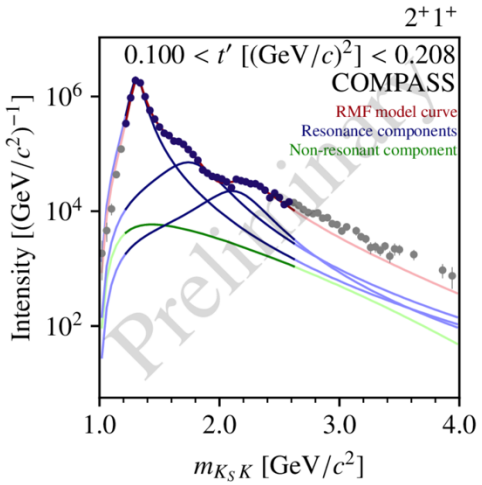
- Clear signals of $\boldsymbol{a_2(1320)}$, $\boldsymbol{a_2(1700)}$, $\boldsymbol{a_4(1700)}$, $\boldsymbol{a_6(2450)}$
- evidence for $\boldsymbol{a_2''}$ at 2124 MeV and $\boldsymbol{a_4'}$ at 2608

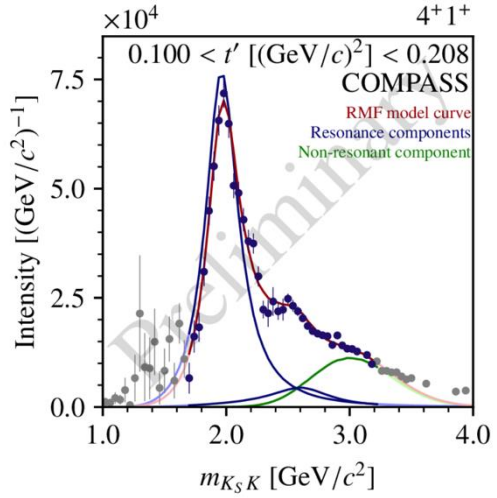
Common signals in $K_S^0 K^-$ and $\omega\pi^-\pi^0$

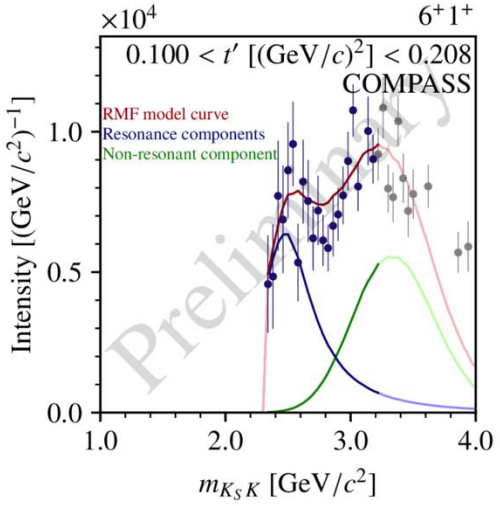






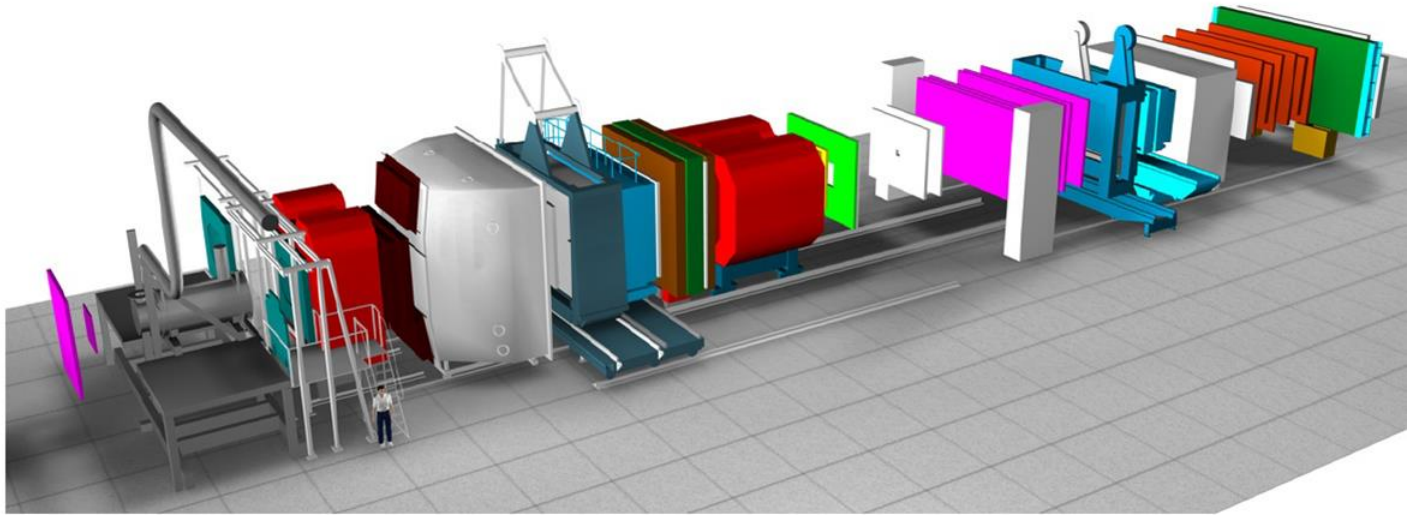






Apparatus for Meson and Baryon Experimental Research

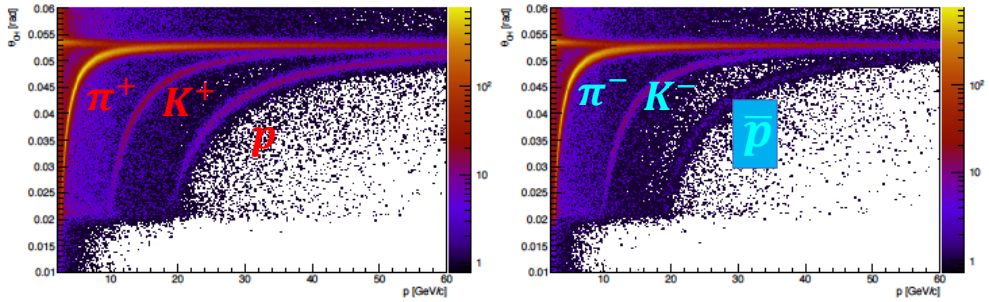
- AMBER has been approved as NA66 experiment in December 2020
- the Collaboration consists of ~200 physicists from 34 institutes
- at the M2 beamline at SPS muon and hadron beams 60 – 250 GeV
- AMBER inherited, extends and modernizes the 2-stage spectrometer of the COMPASS collaboration



- **Approved Phase I** physics:
  - $\bar{p}$ production cross-sections
  - proton radius
  - pion/kaon structure functions
- Intended **Phase II** physics (>LS4):
  - strange-meson spectroscopy
  - kaon polarizability
  - prompt-photon production

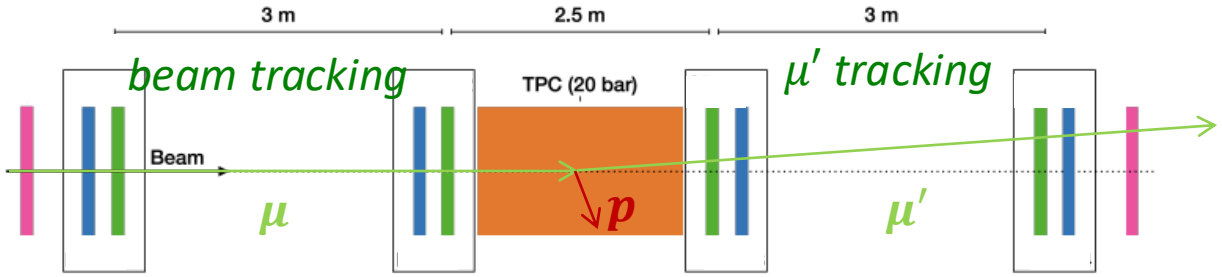
AMBER Phase-1 in a nutshell

- **Anti-proton production cross sections** in p-He and p-p collisions for constraining cosmic dark-matter search data: unique data sets in unexplored beam momentum range 60-250 GeV, successful p-He data taking in 2023, p-p and p-D in 2024

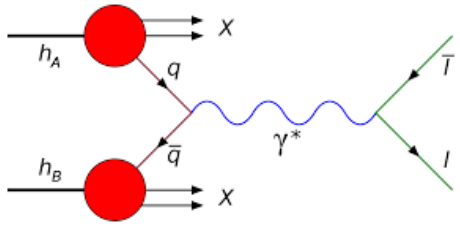


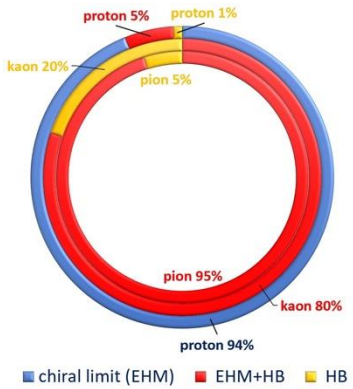
RICH PID: Cerenkov angle vs. momentum

- **Proton radius** via muon-proton scattering, recoiling proton and scattered muon are measured in coincidence: unique in terms of systematics control



- **Pion and kaon partonic structure** via Drell-Yan processes: separate valence and sea contributions in unprecedented precision

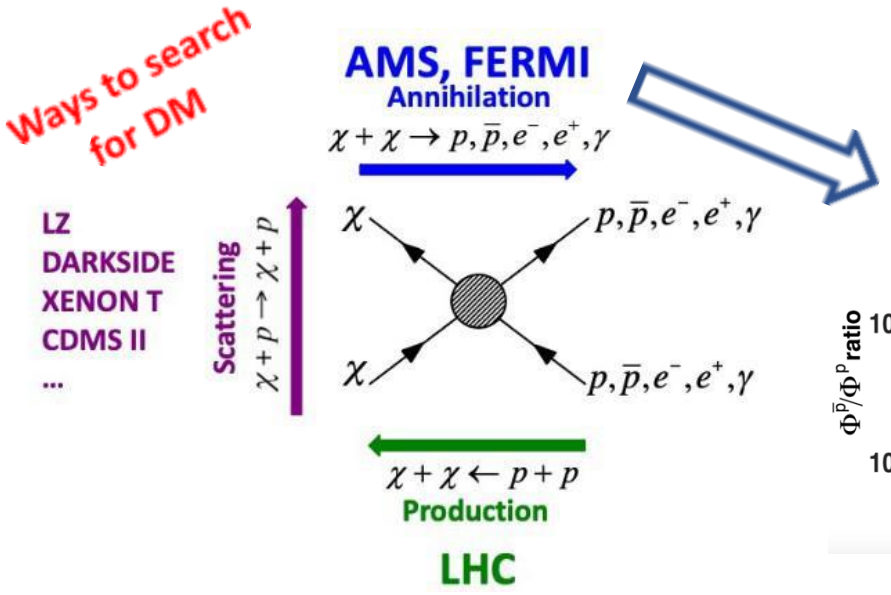


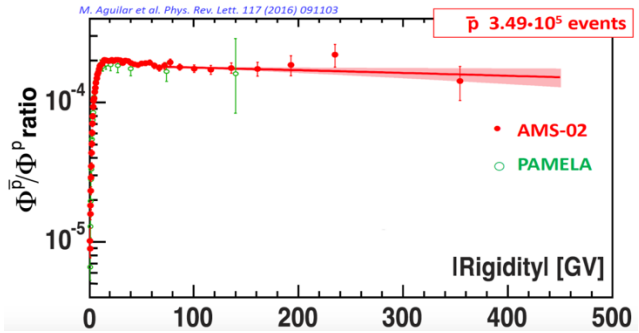


Mass budgets: **emergence** of the light-hadron masses is linked to both the QCD partonic structure and to confinement

plot courtesy C. Robert

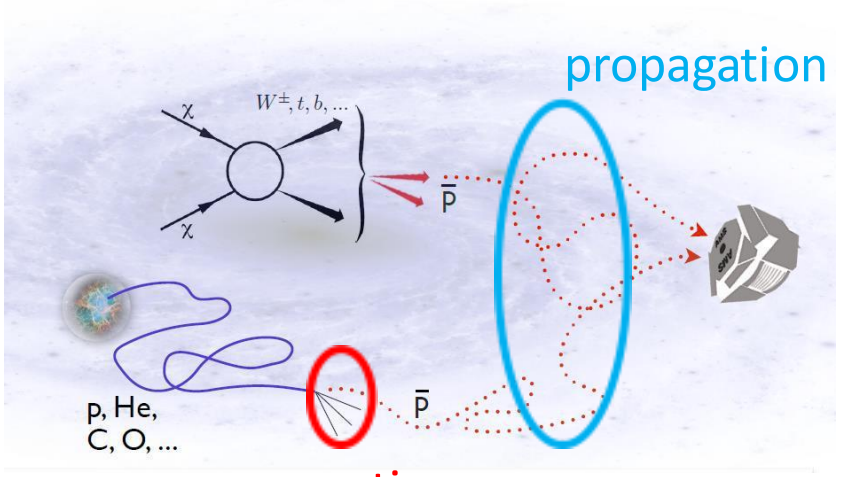
Antiproton production cross-sections for dark-matter searches

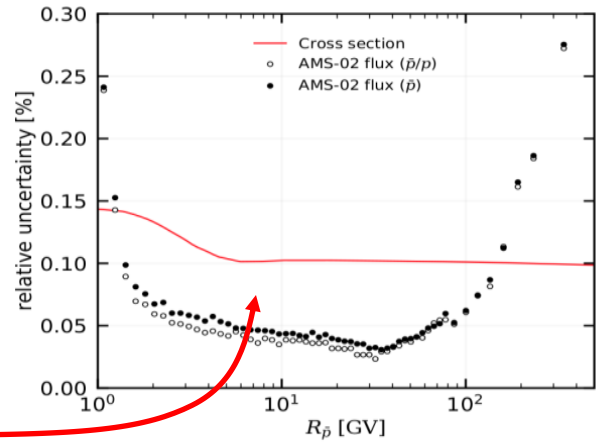


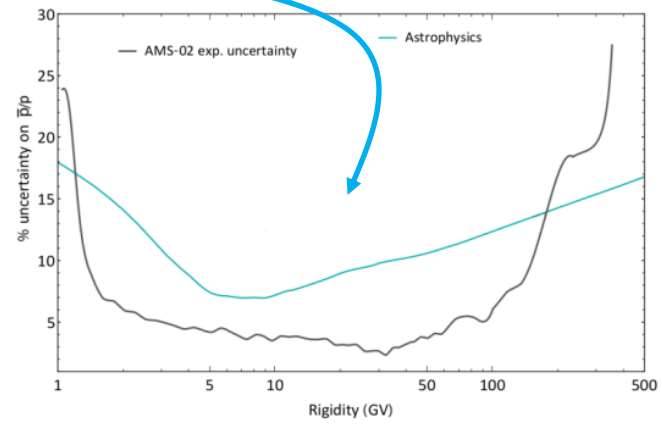


AMBER:

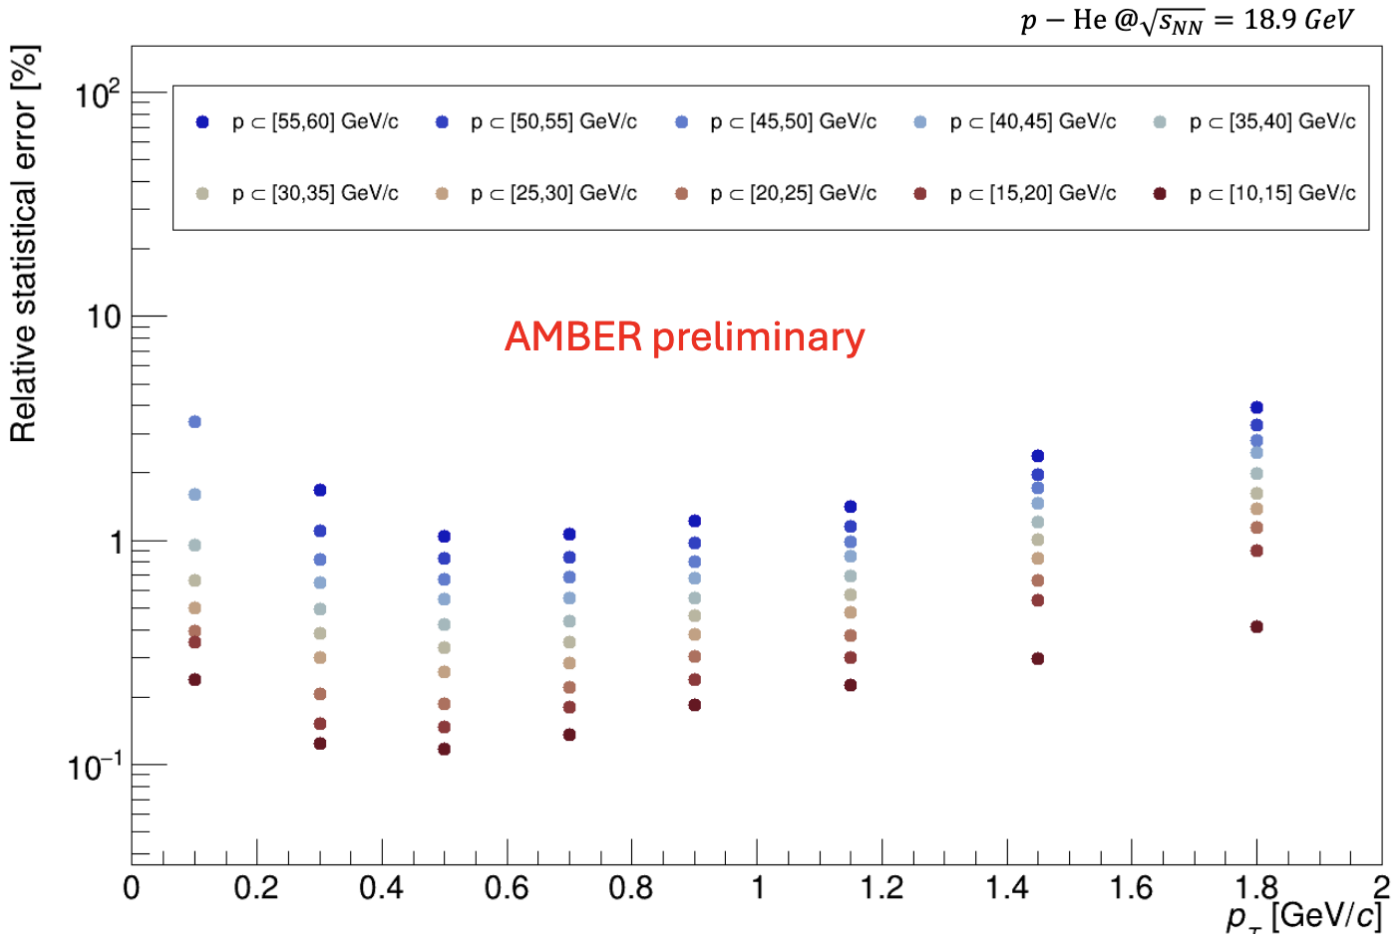
- Data for p-He collisions taken in summer 2023
- Data for p-p and p-D taken in 2024







Antiproton production cross-sections: uncertainty estimates



- A preliminary analysis shows that we collected ~6million antiprotons in
  - p [10, 60] GeV/c
  - p_T [0, 2] GeV/c
- Statistical uncertainty in most bins < 1%
- Leading systematic uncertainties expected from:
  - Luminosity
  - RICH

Measurement of G_E^p at small Q^2

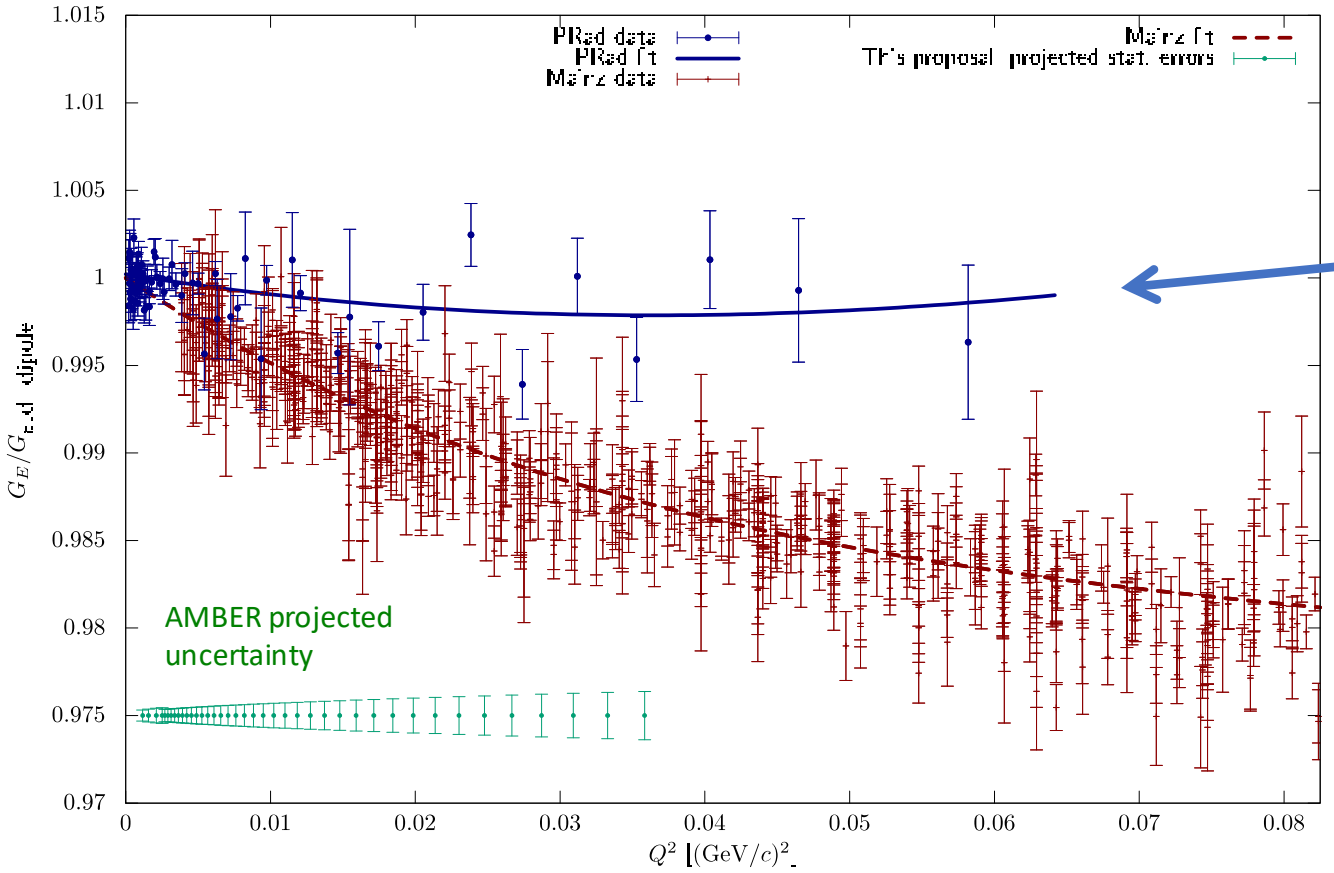


figure: J. Bernauer

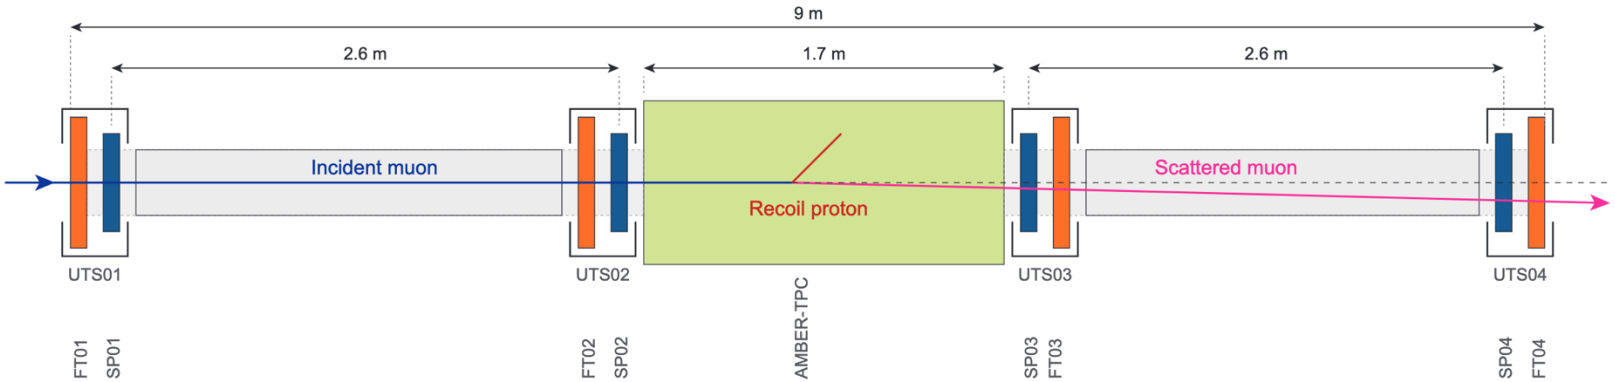
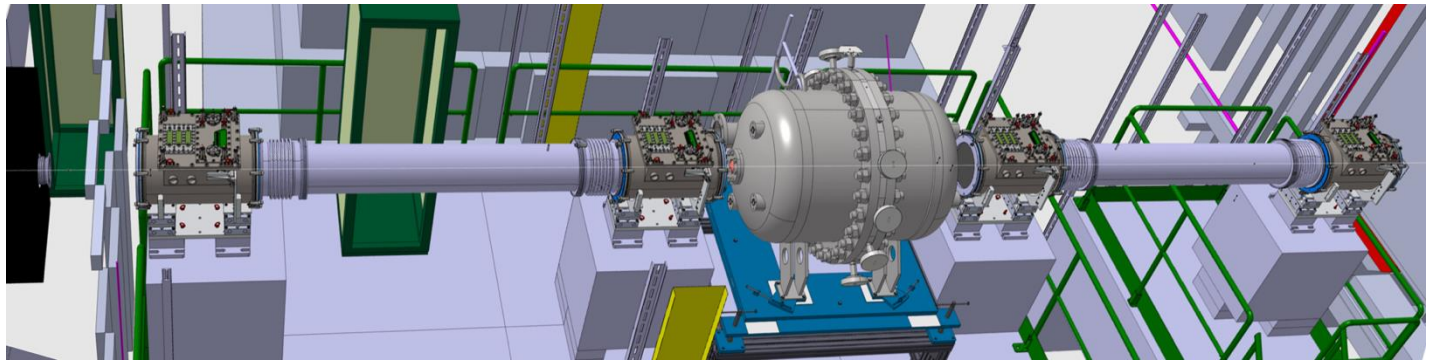
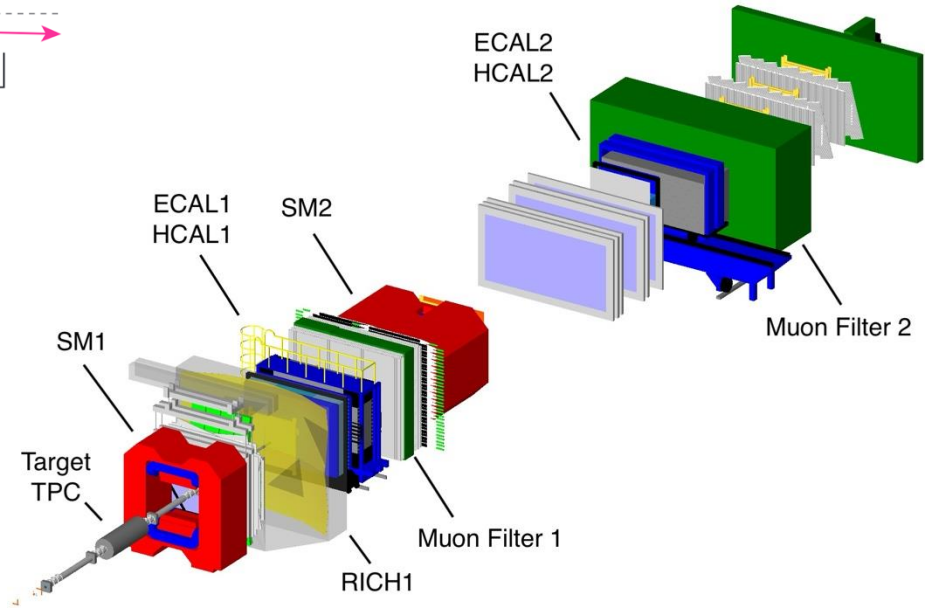
Basic Idea of the AMBER measurement



- 100 GeV **muon** beam
- Active-target TPC with high-pressure H_2
- high-precision tracking and spectrometer for muon reconstruction
- goal: 70 million elastic scattering events in the range $10^{-3} < Q^2 < 4 \cdot 10^{-2}$ GeV^2
- Precision on the proton radius ~0.01 fm



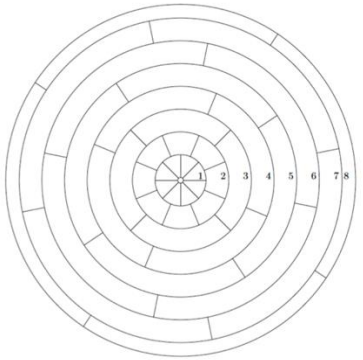


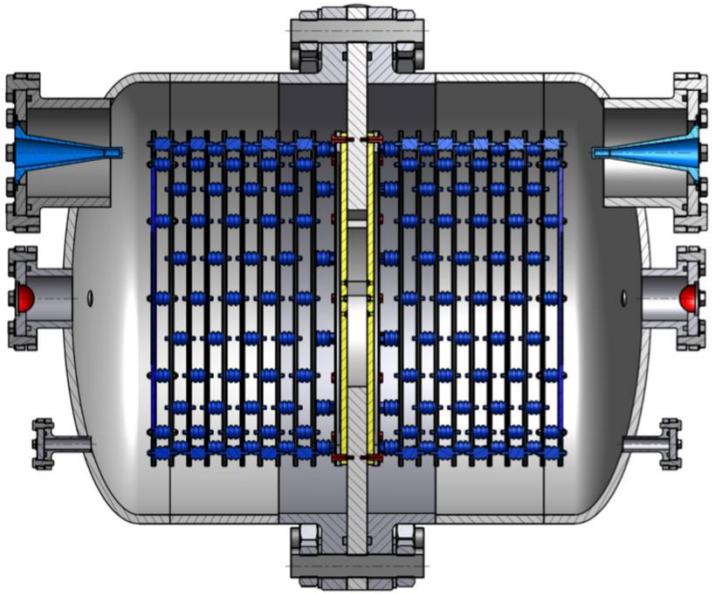
New Equipment for PRM

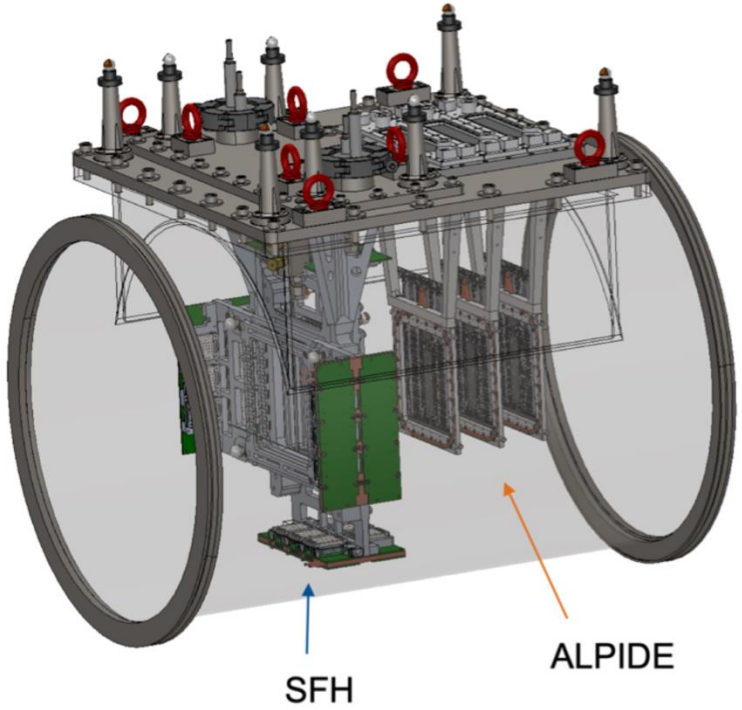
High-pressure hydrogen TPC
- Operation at 20 bar hydrogen pressure
- design with 2 drift cells
- Segmented anode plane
- reconstruction of proton recoil energy with ~50 keV precision

Unified Tracking Stations
- Determine scattering angle of muon
- Consists of several layers of silicon pixel detectors (ALPIDE) and a scintillating-fiber hodoscope (SFH)

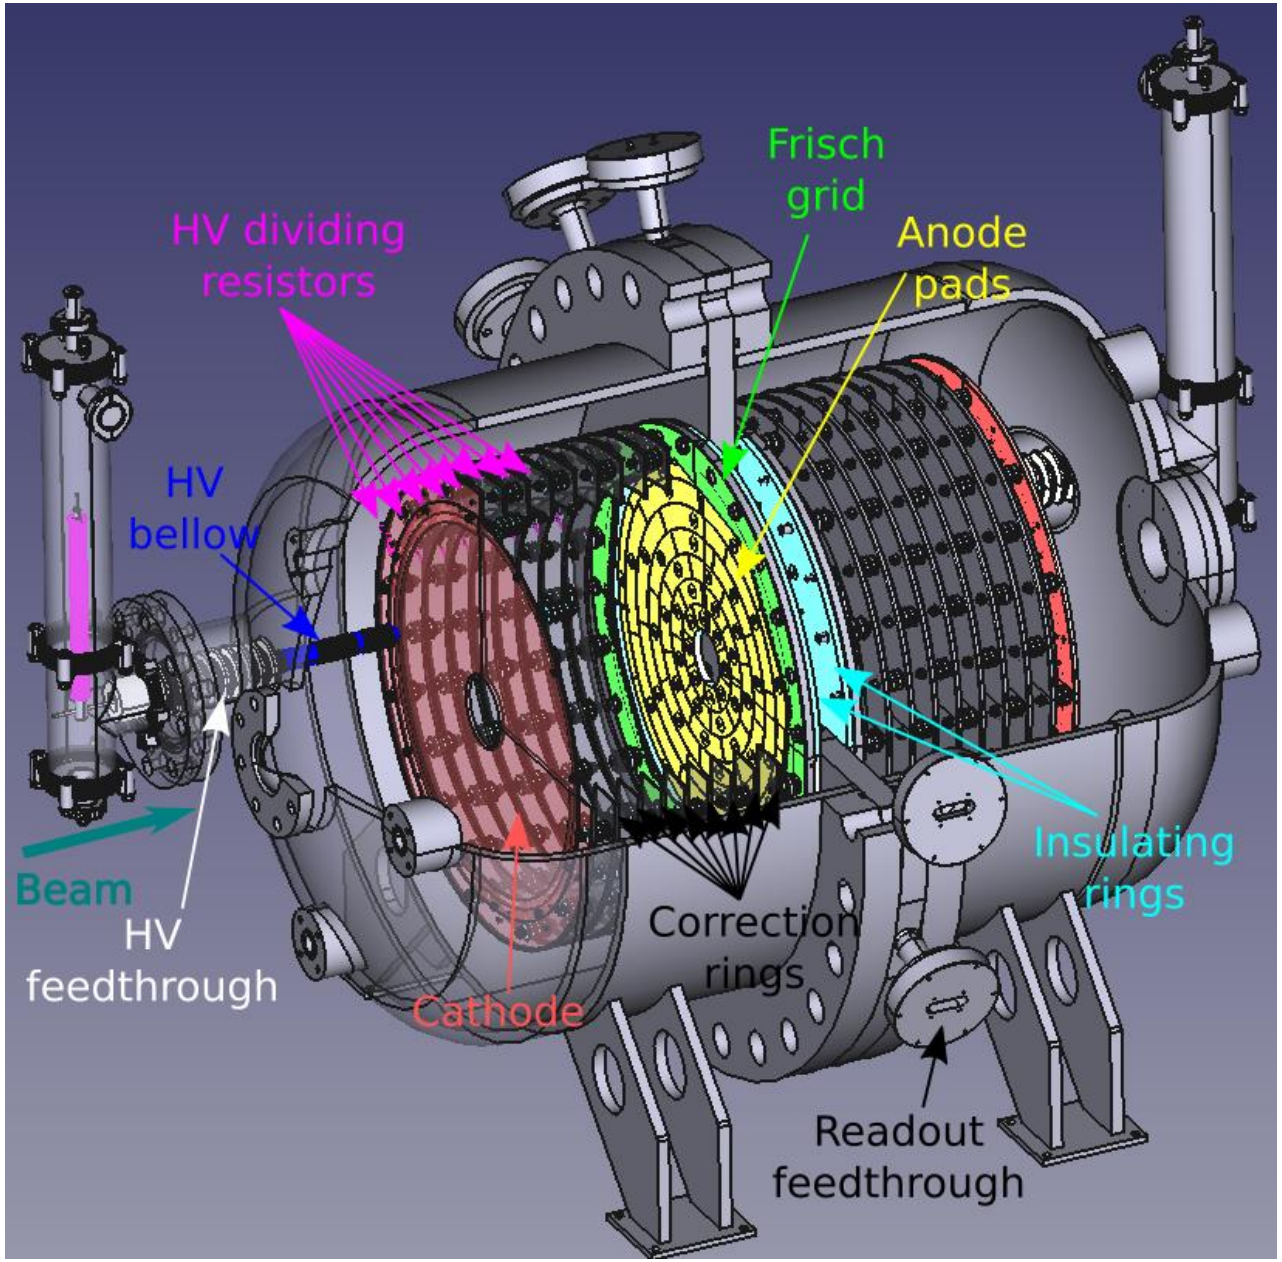
Free-running DAQ
- streaming data acquisition on first level: all detectors deliver data without external trigger
- high-level trigger on computer farm







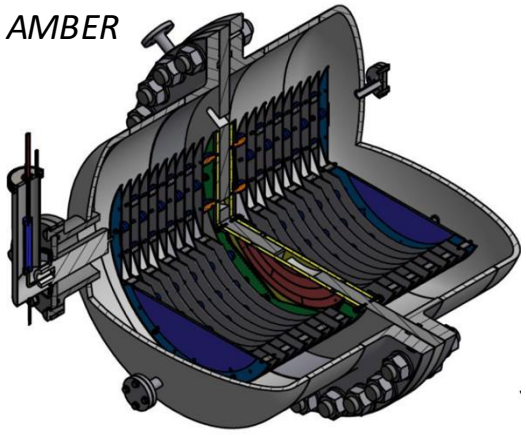
TPC layout



HV dividing resistors
Frisch grid
Anode pads
HV bellow
Beam
HV feedthrough
Cathode
Correction rings
Insulating rings
Readout feedthrough

New High-Pressure Time Projection Chamber

CAD of the new AMBER TPC



- Cooperation with GSI/FAIR (Germany), later usage is foreseen at FAIR/R3B
- Successful overpressure tests at the production site (up to 32 bar)
- Leak rate under pressure and preliminary checks done at GSI, now transported to CERN

Factory Acceptance Test at the Danish production site, May 2024

Electrode and Readout Anode Structure

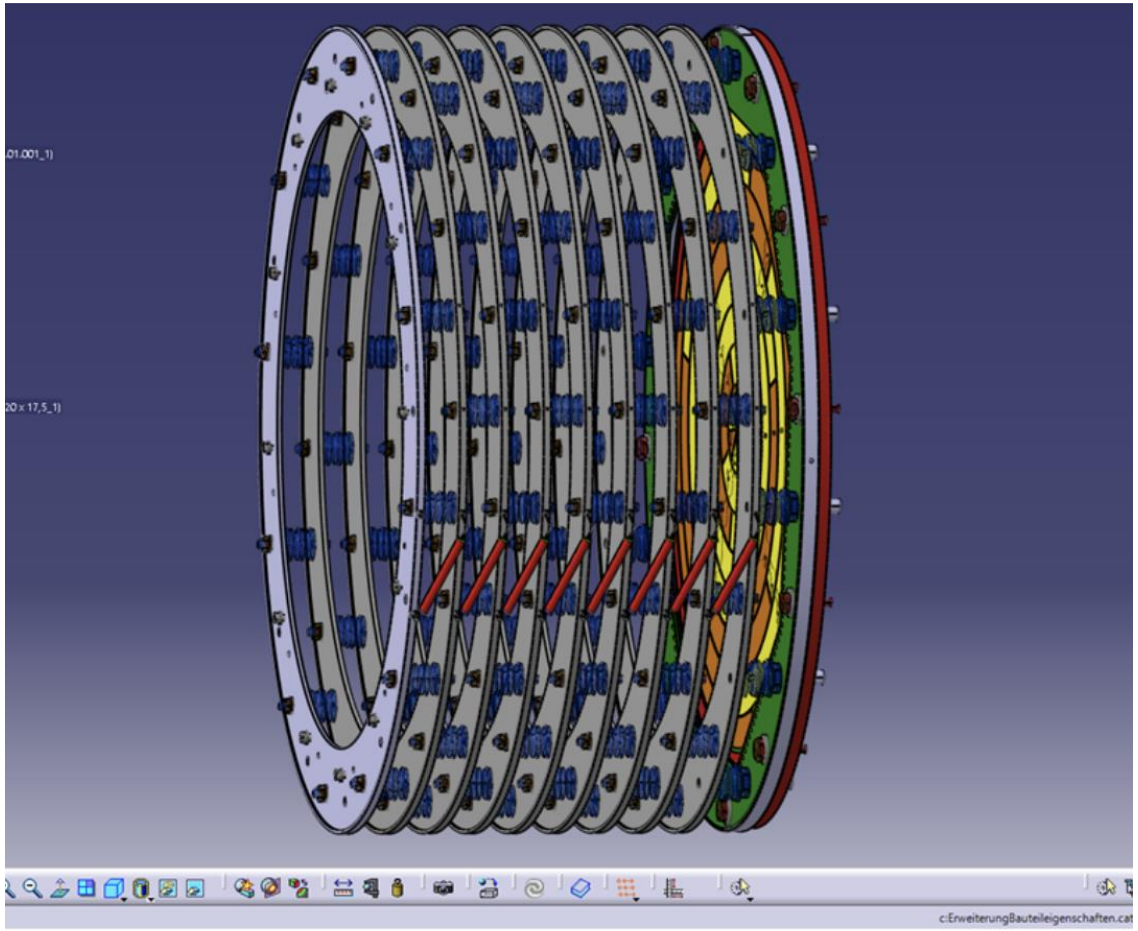


Fig. 26: CAD drawing of the TPC inner electrode structure.

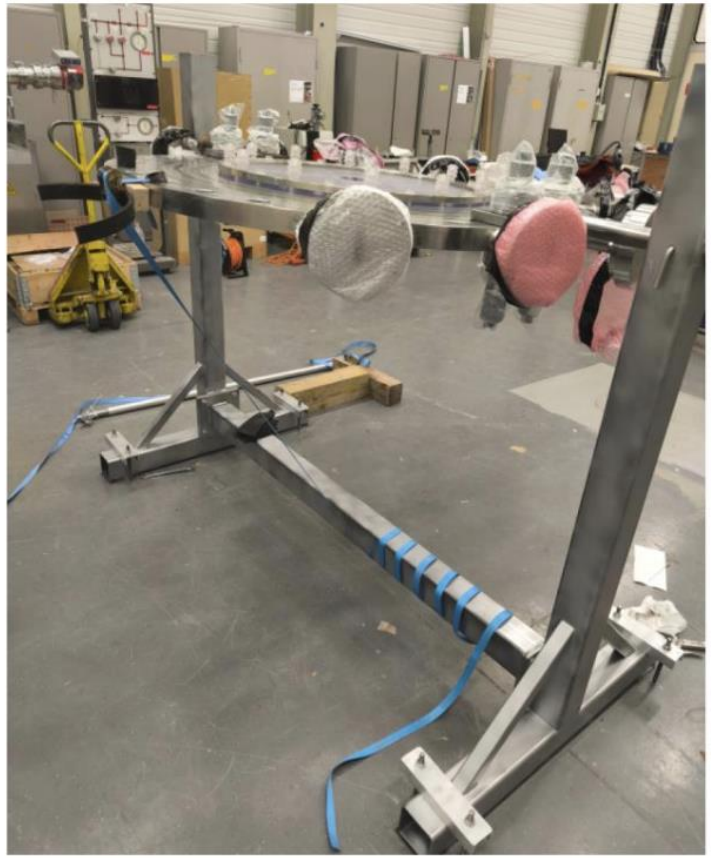
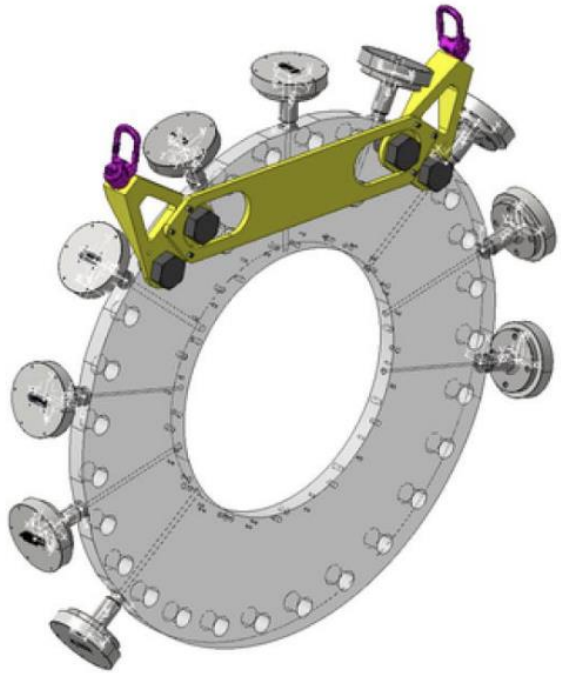
- Assembly currently ongoing at CERN
- at two positions, α sources are to be implemented that will provide calibration signals during data taking

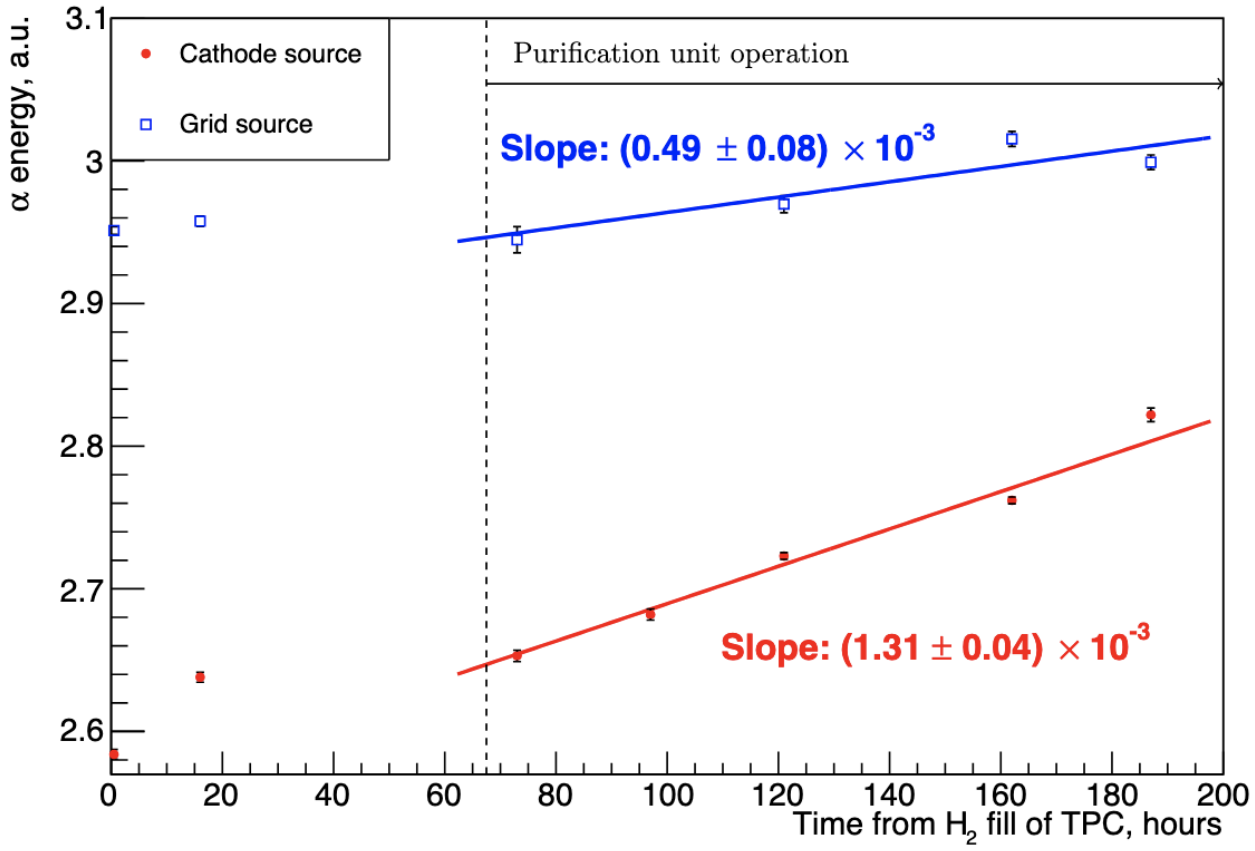
Assembly of the TPC





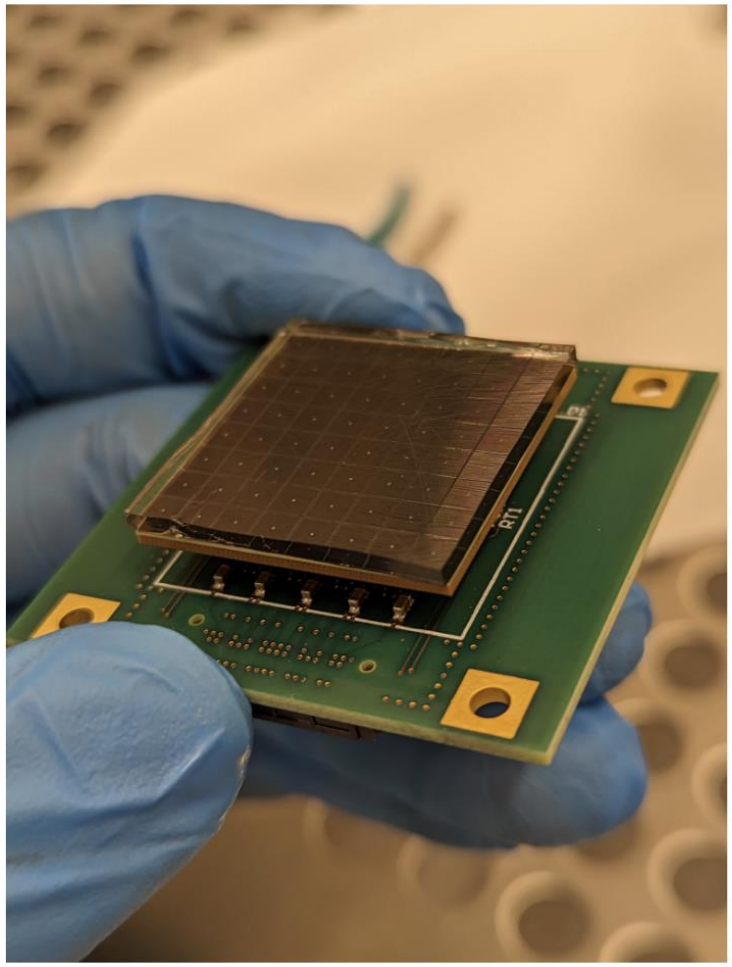
Assembly of the TPC

Hydrogen Gas Purification

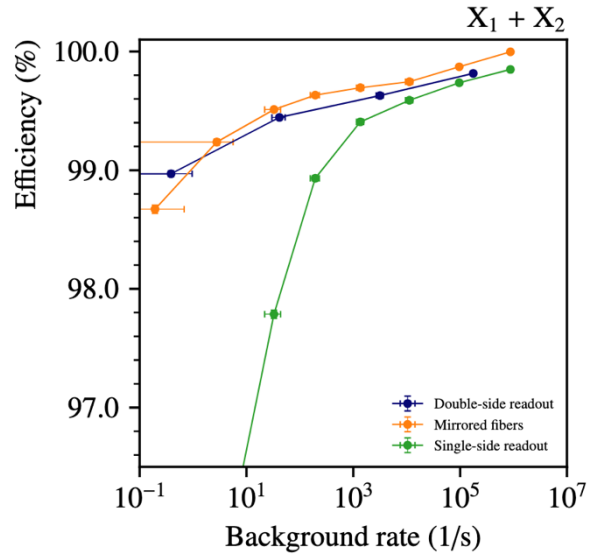


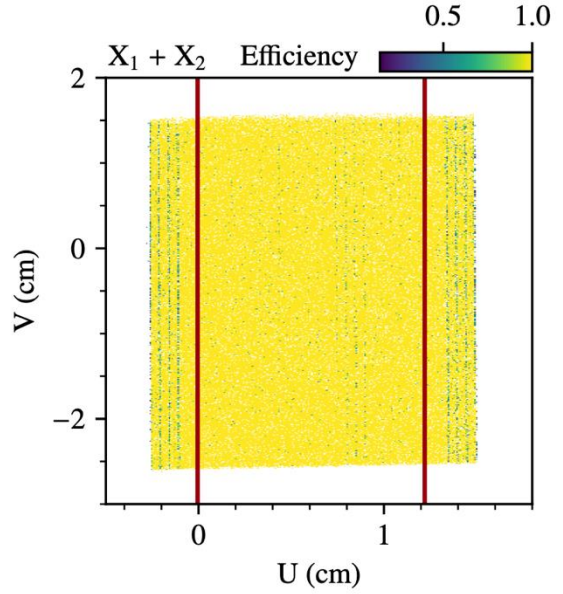
- Tests in 2023 with the old IKAR TPC and a new purification unit
- the increase of the amplitude from the α sources is a measure of the purity of the detector gas
- stronger effect by the cathode source (longer drifts)

Scintillating-Fiber Hodoscope



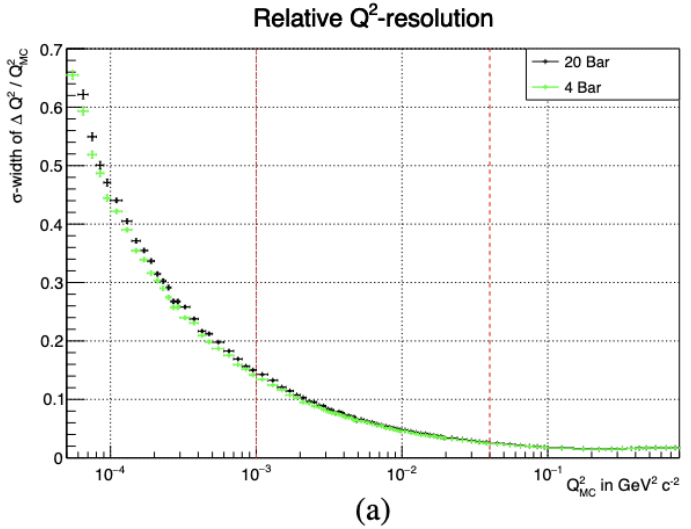
(a) UTS with SFH prototype in the target area. (b) Gel pad used to improve the SiPM-fiber coupling in the SFH prototype.

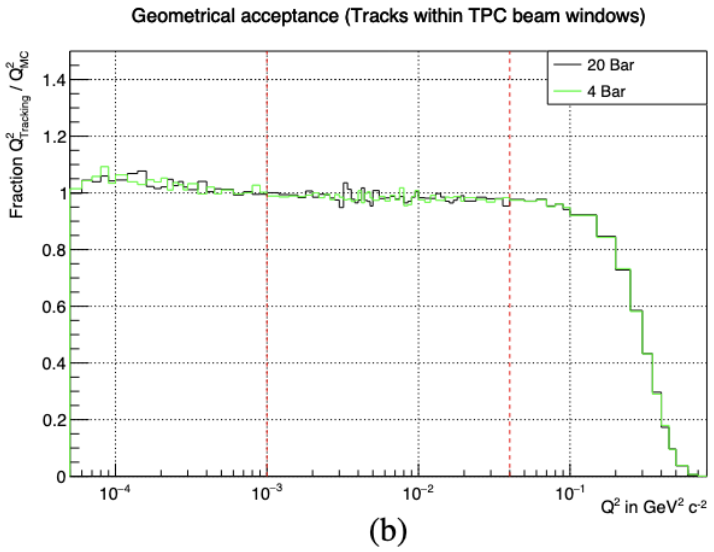




Simulation of the PRM Setup

- The AMBER setup for the Proton Radius Measurement has been implemented in a GEANT4 Monte-Carlo simulation
- from the reconstructed MC data, the achieveable resolution in Q^2 has been studied and found better than 15% in the targeted range $Q^2 > 10^{-3}\ \mathrm{GeV}^2$ for both TPC pressure settings at 4 and 20 bar
- the geometrical acceptance is found to be flat in the relevant Q^2 range





Tests and Schedule for PRM Data Taking

2018: First measurement of hydrogen TPC in high-energy muon beam

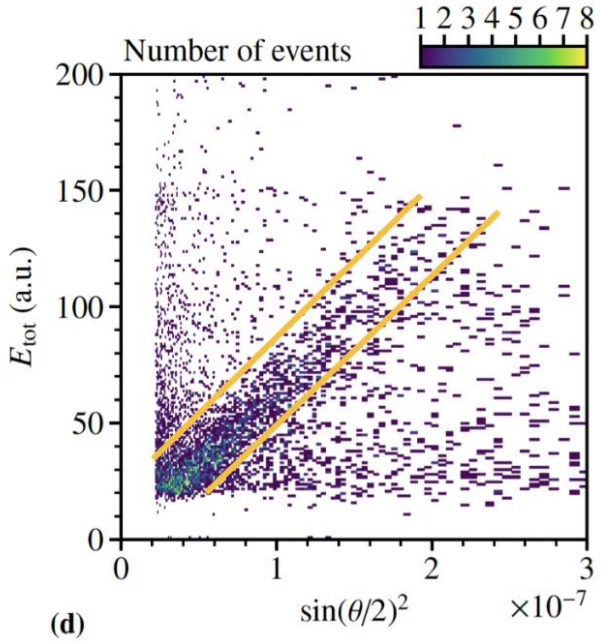
2021: First test run with IKAR TPC and already existing tracking detectors from COMPASS → *correlation between proton energy and muon scattering angle*

2023: Test run with new free-running DAQ (IKAR TPC, new tracking detector prototypes)

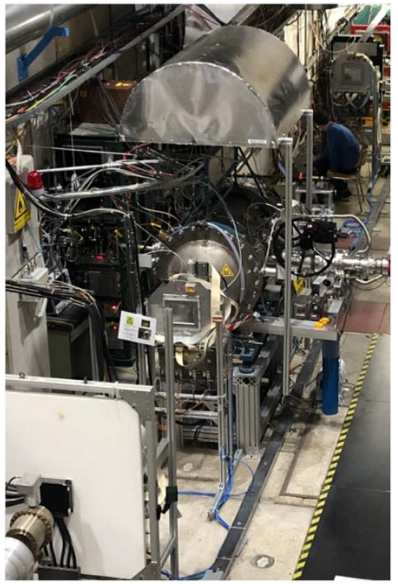
2024: Tests of detector prototypes

2025/26: Physics run with new TPC and final UTS

2018

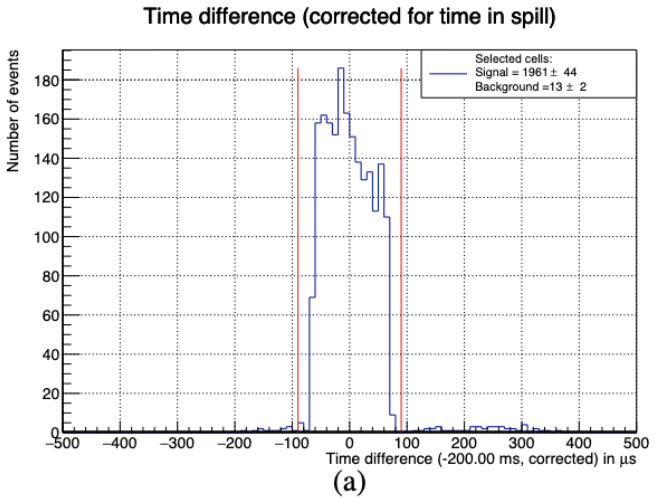


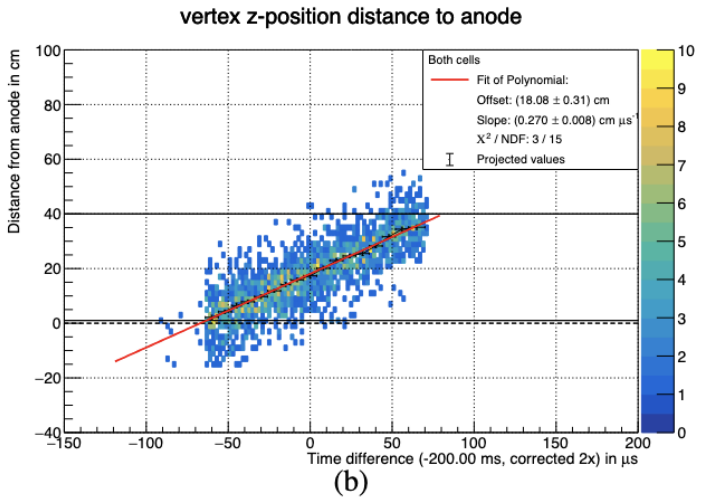
2021

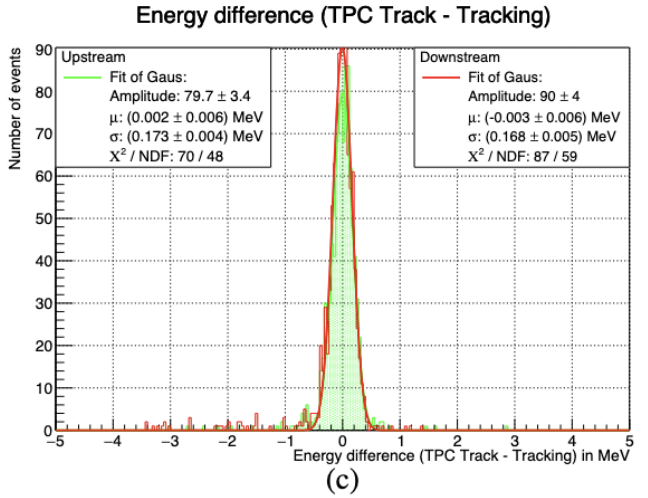


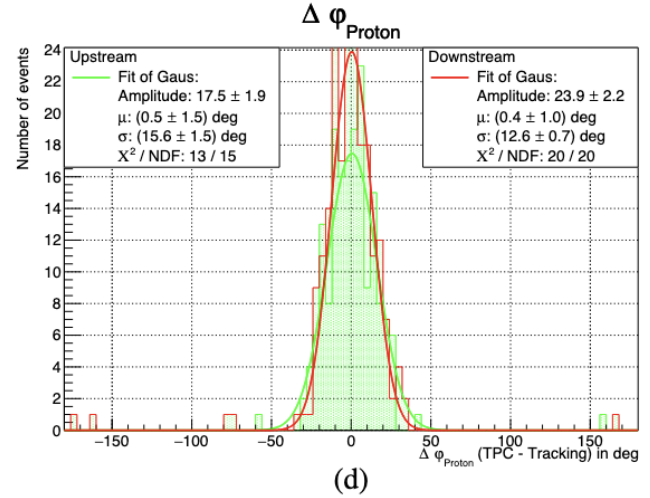
Figures: C. Dreisbach PhD Thesis (2022)

Test Data Analysis



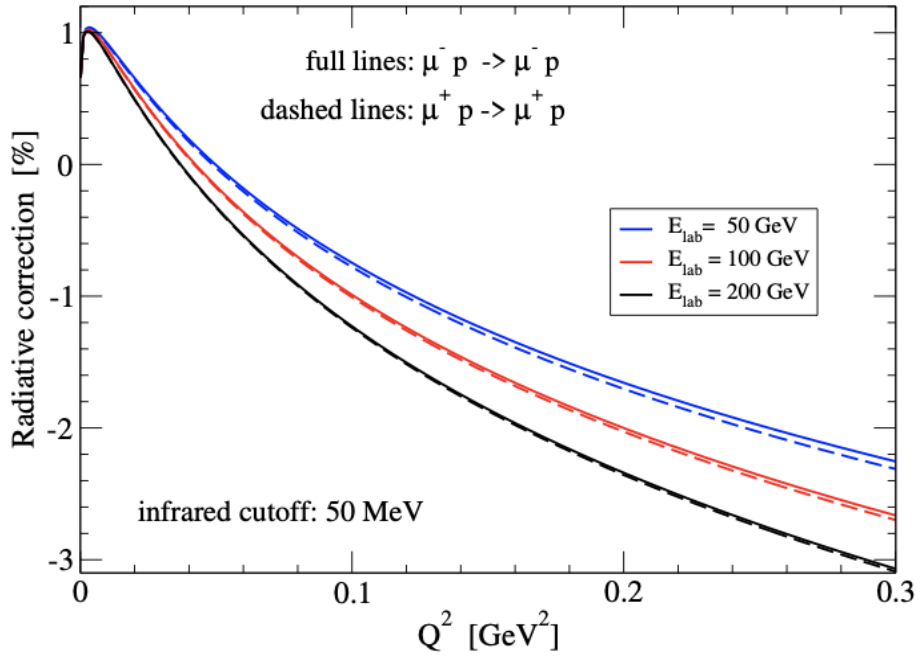


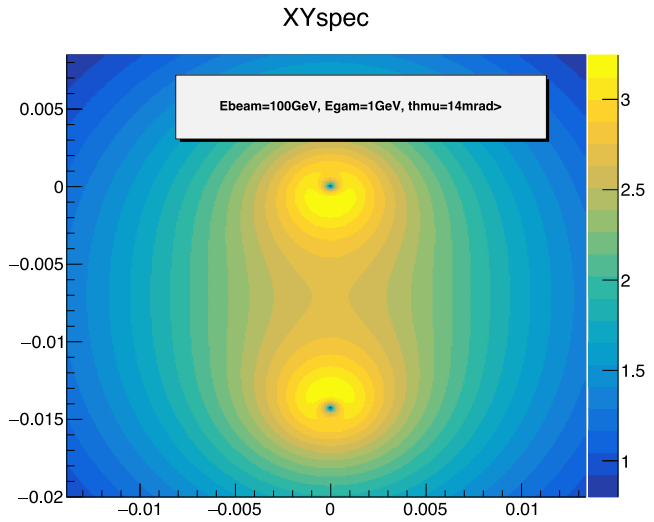


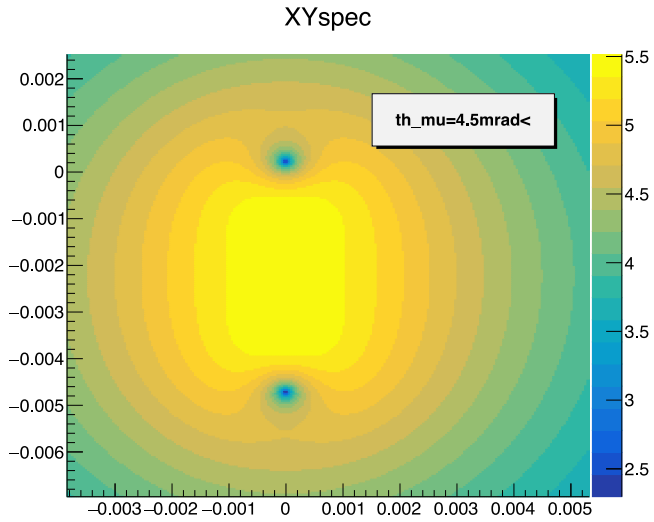


- With the 2021 test data, the correlations of the **muon scattering** and the **proton recoils** in the IKAR TPC were studied in detail
- in the coincidence time, the effect of the **drift** in the TPC gas could be identified, this will serve to control the purity of the elastic scattering events
- the expected correlations in $E_{kin} = Q^2/2M_p$ and in the azimuthal angle could also be shown

Radiative Corrections for μp Scattering







- Radiative corrections <1% for muon-proton scattering $Q^2 < 0.04\ \mathrm{GeV}^2$
- Calculations by N. Kaiser (TUM) *J. Phys. G* **37** 115005 (2010)
- Full MC generator foreseen – intensity forward bremsstrahlung photons can be checked in the experiment
- Collaboration with McMule team on implementation of higher-order corrections for the AMBER kinematics

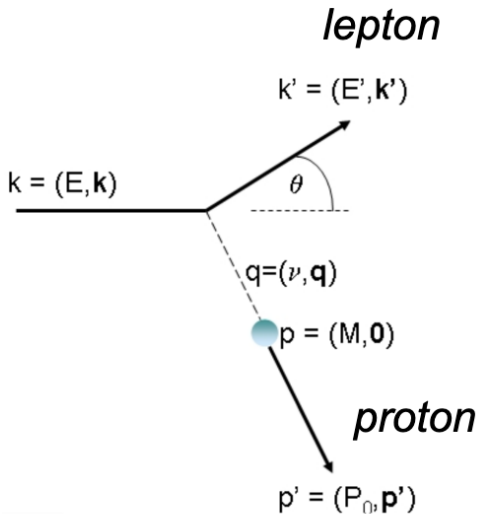
On the agenda for AMBER phase 2: Hadron charge radii

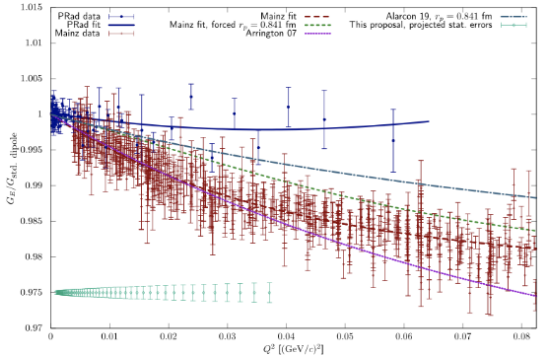
Protons in hydrogen target (or other stable nuclei):
Measurement via elastic electron or muon scattering
Cross section:

$$\frac{d\sigma}{dQ^2} = \frac{4\pi\alpha^2}{Q^4} R \left(\varepsilon G_E^2 + \tau G_M^2\right)$$

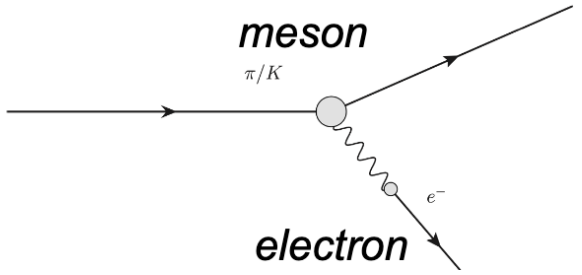
Charge radius from the slope of G_E

$$\langle r_E^2 \rangle = -6\hbar^2 \left. \frac{\mathrm{d}G_E(Q^2)}{\mathrm{d}Q^2} \right|_{Q^2 \to 0}$$





For unstable particles, electron scattering can only be realised in *inverse kinematics*



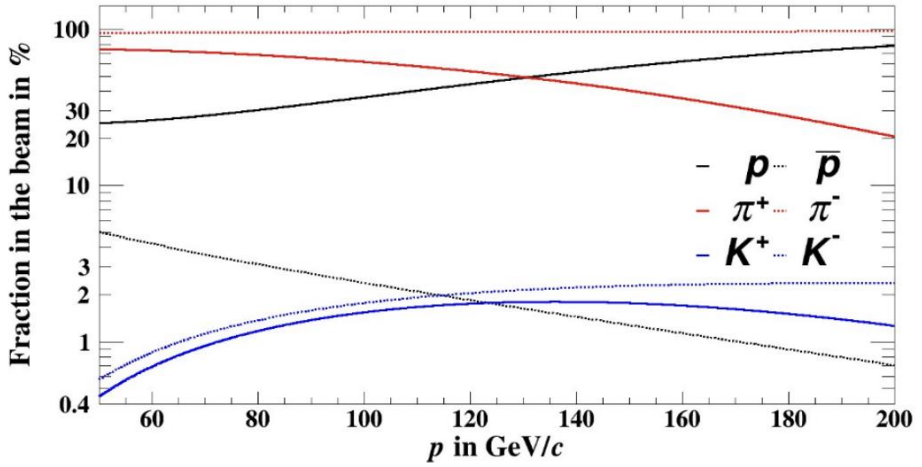
Spectroscopy plans for AMBER phase 2: intense kaon beams

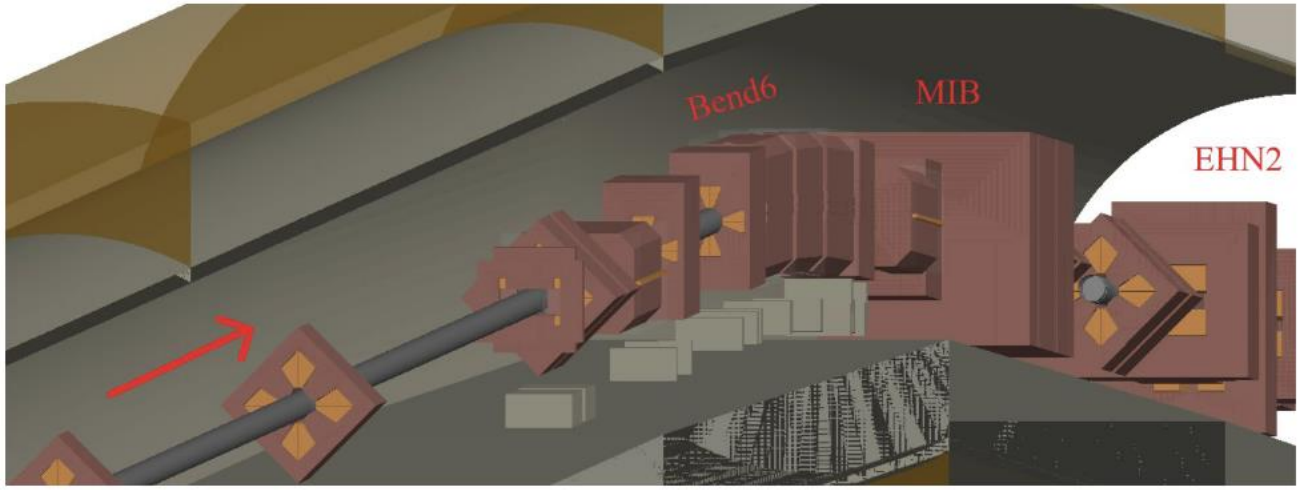
Worldwide unique experiments:

- measure kaon quark and gluon PDF (DY, prompt photons)
- spectroscopy of K_J, K_J^* in diffractive production
- electromagnetic/Primakoff reactions with kaons

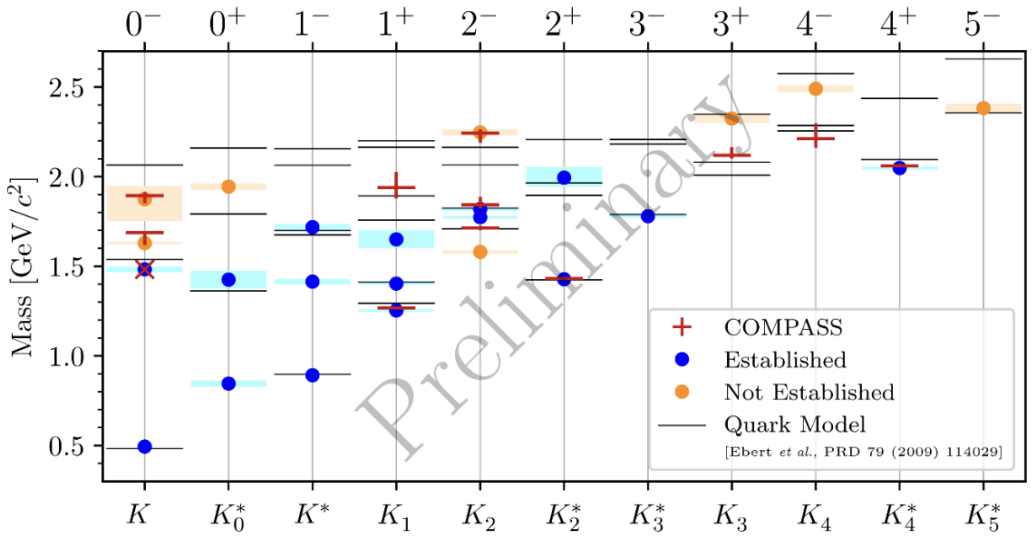
Requirements:

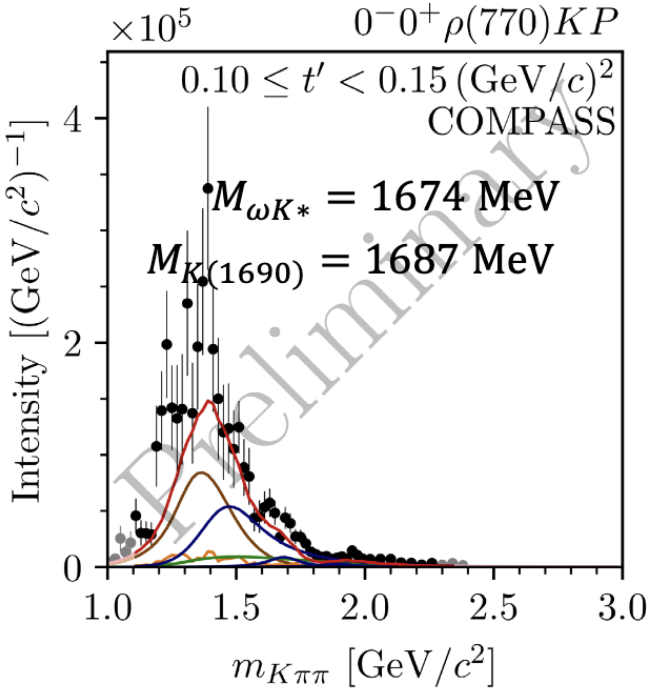
- Highest possible intensity of K in secondary beam
  - ~~RF separation~~
  - conventional mixed beam: optimize transport
- High-efficiency / high-purity beam particle identification
- Final-state PID at higher momenta (depending on beam momentum)
- Full solid-angle coverage for photons / electrons





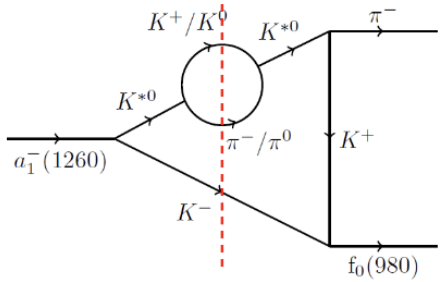
COMPASS kaon spectroscopy results





COMPASS:

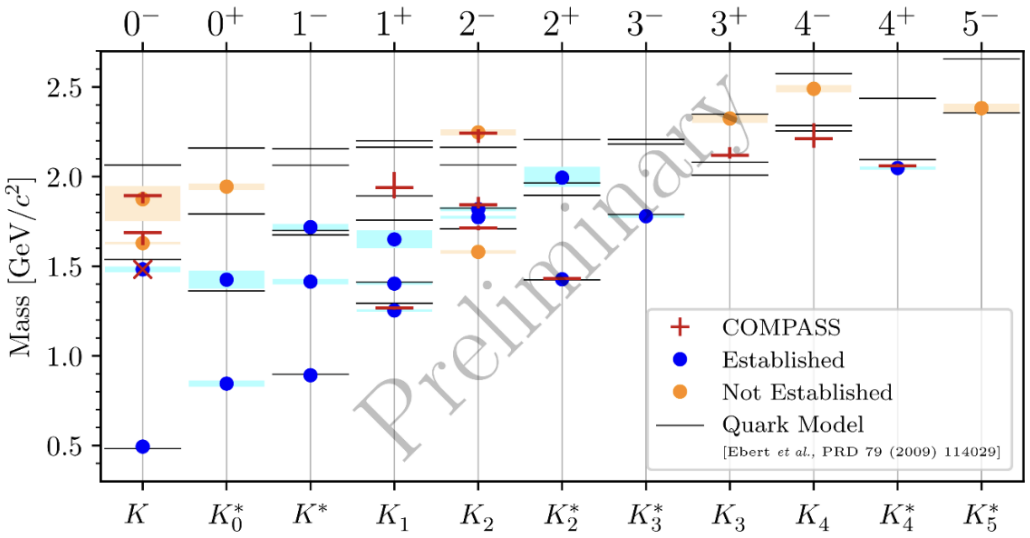
- 11 strange mesons found ⇒ results to be published soon
- evidence for 3 excited KK states
- quark model only predicts 2: $K(1460)$, $K(1830)$?
- $K(1690)$ supernumerary ⇒ candidate for exotic strange meson

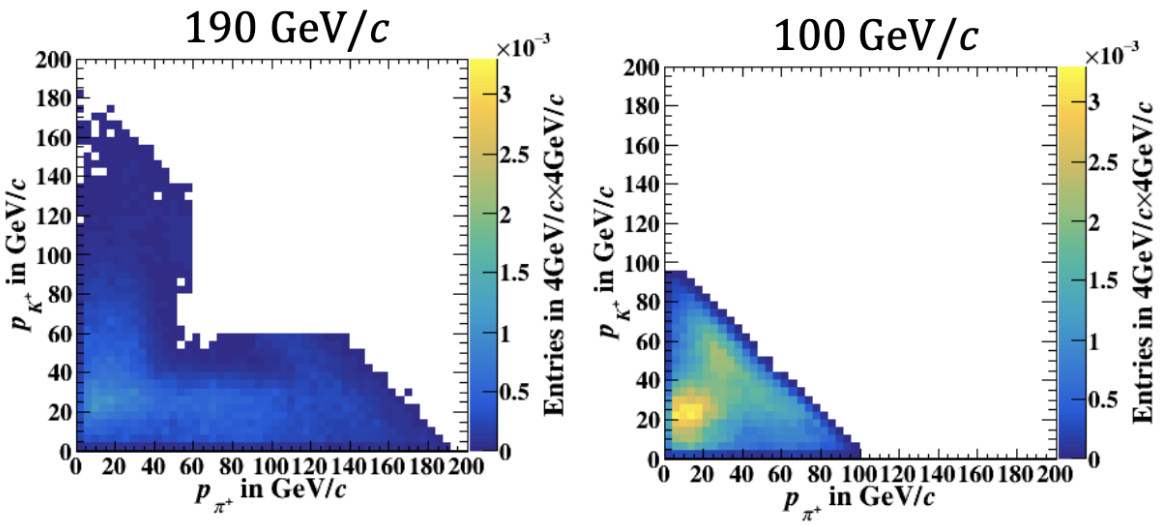


Triangular singularity?

[COMPASS, M.G. Alexeev et al., PRL 127, 082501 (2021)]

Kaon spectroscopy plans at AMBER





COMPASS:

- 11 strange mesons found ⇒ results to be published soon
- evidence for 3 excited KK states
- quark model only predicts 2: $K(1460)$, $K(1830)$?
- $K(1690)$ supernumerary ⇒ candidate for exotic strange meson
- statistically and systematically limited: 720k events, PID

AMBER Phase-2:

- Beamline upgrade (NA-CONS)
- Improved beam K identification
- Improved final-state K identification
- Full solid-angle coverage for photons / electrons
- Goal: 20×10^6 exclusive $K^- \pi^- \pi^+$ events

Summary

- New results from COMPASS partial-wave analysis in $\omega\pi^-\pi^0$ and $K_S^0K^-$

- NA66/AMBER at CERN has **started its Phase-1** of a broad hadron physics programme at M2
- Data taking for anti-proton production cross-sections in p-He, p-p and p-D completed, analysis ongoing
- Proton Radius Measurement
  - first running in 2025, high-statistics data taking planned for 2026

- Plans for a strange-meson spectroscopy program at AMBER Phase-2

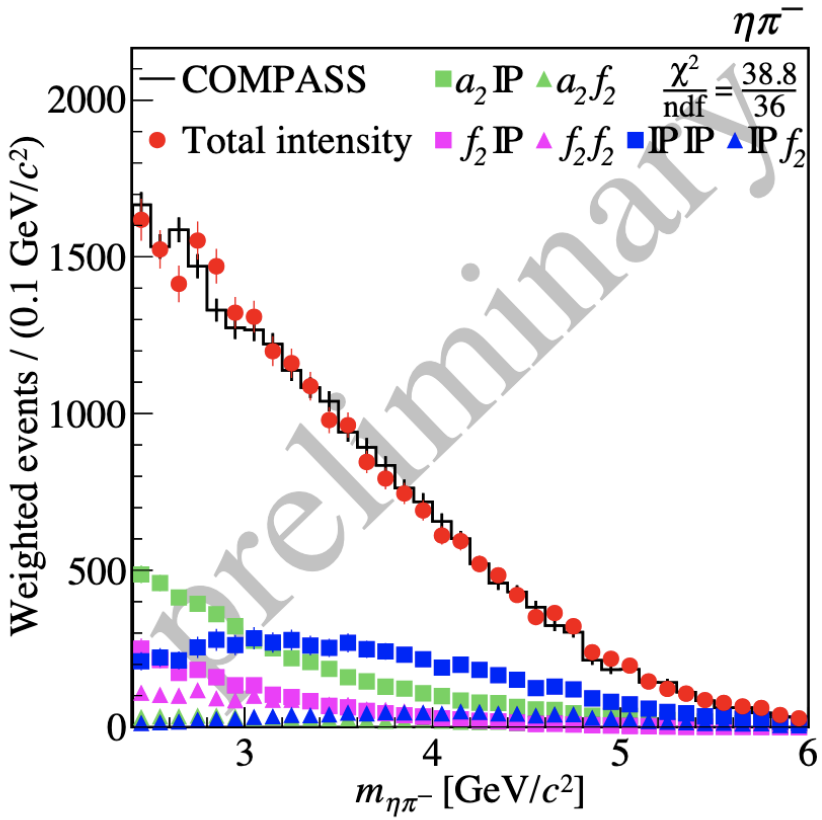
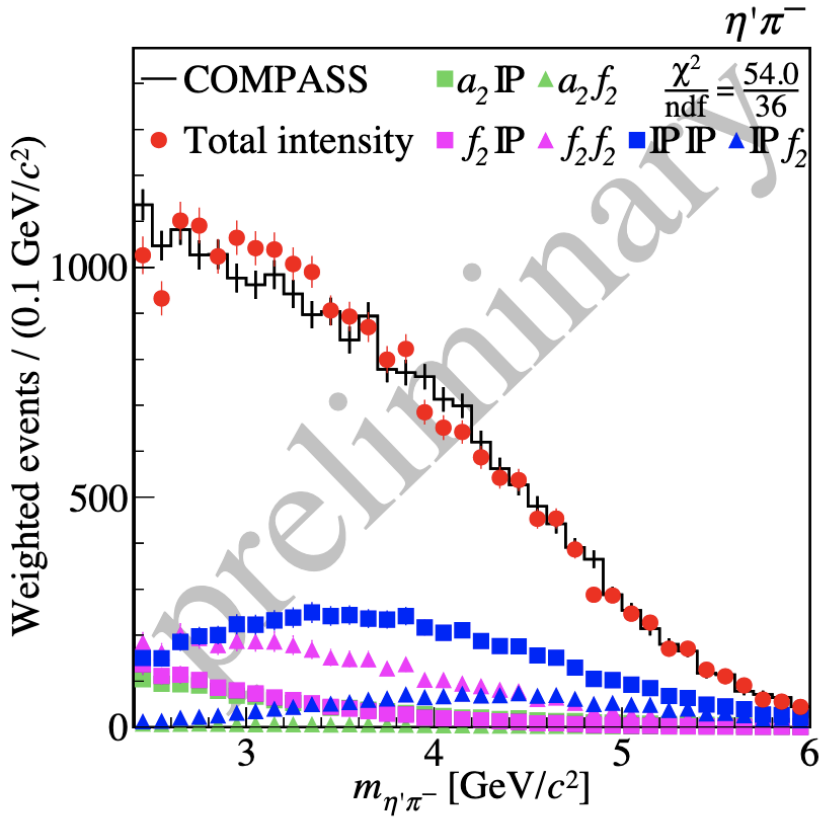
mass dependence of the double-Reggeon contributions

$\eta\pi^-$

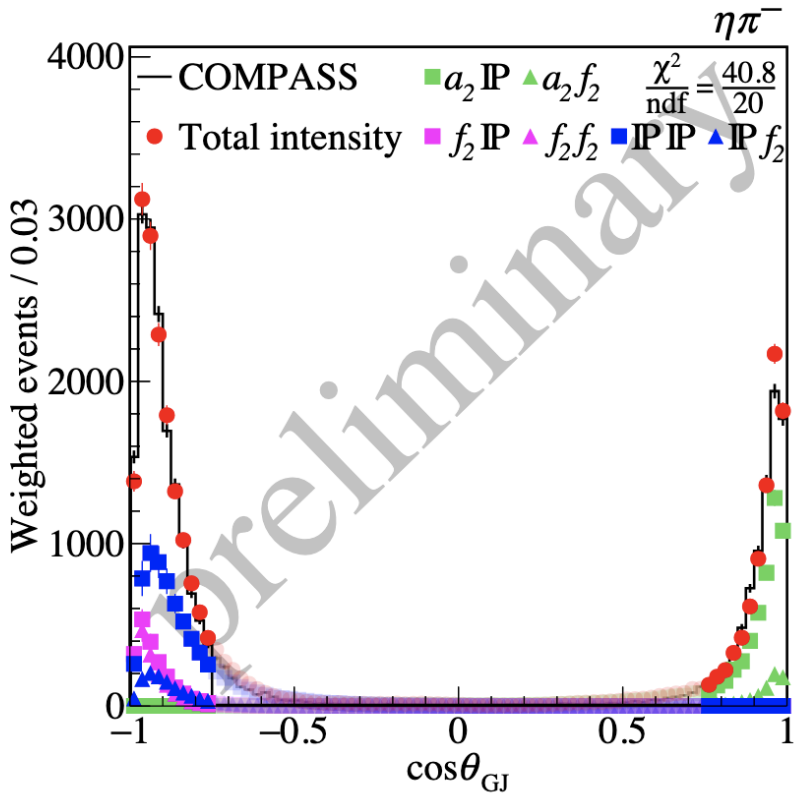


$\eta'\pi^-$

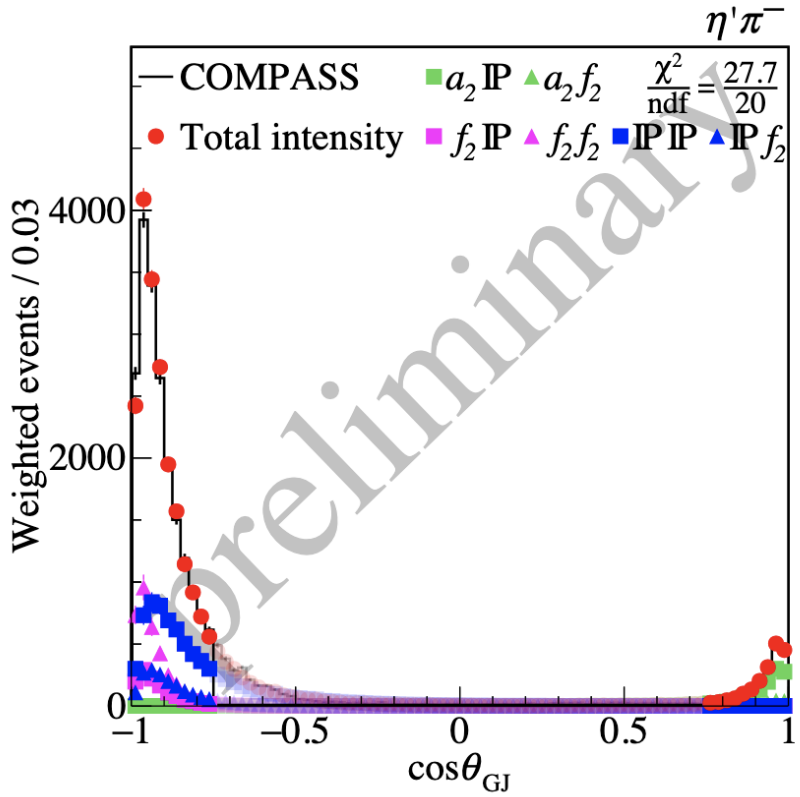


propagation to the full $\cos\vartheta_{\mathrm{GJ}}$ spectrum

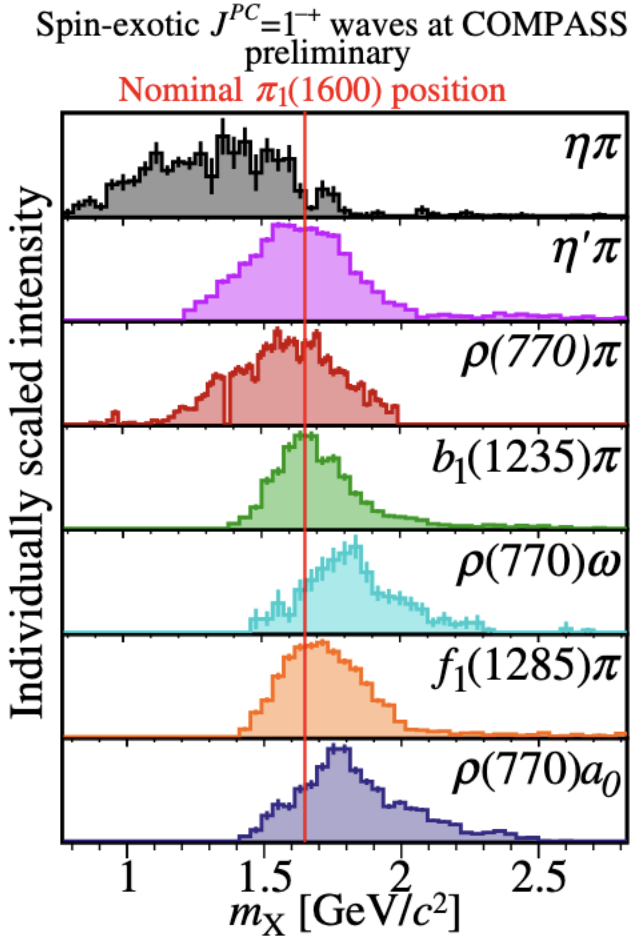
$\eta\pi^-$



$\eta'\pi^-$



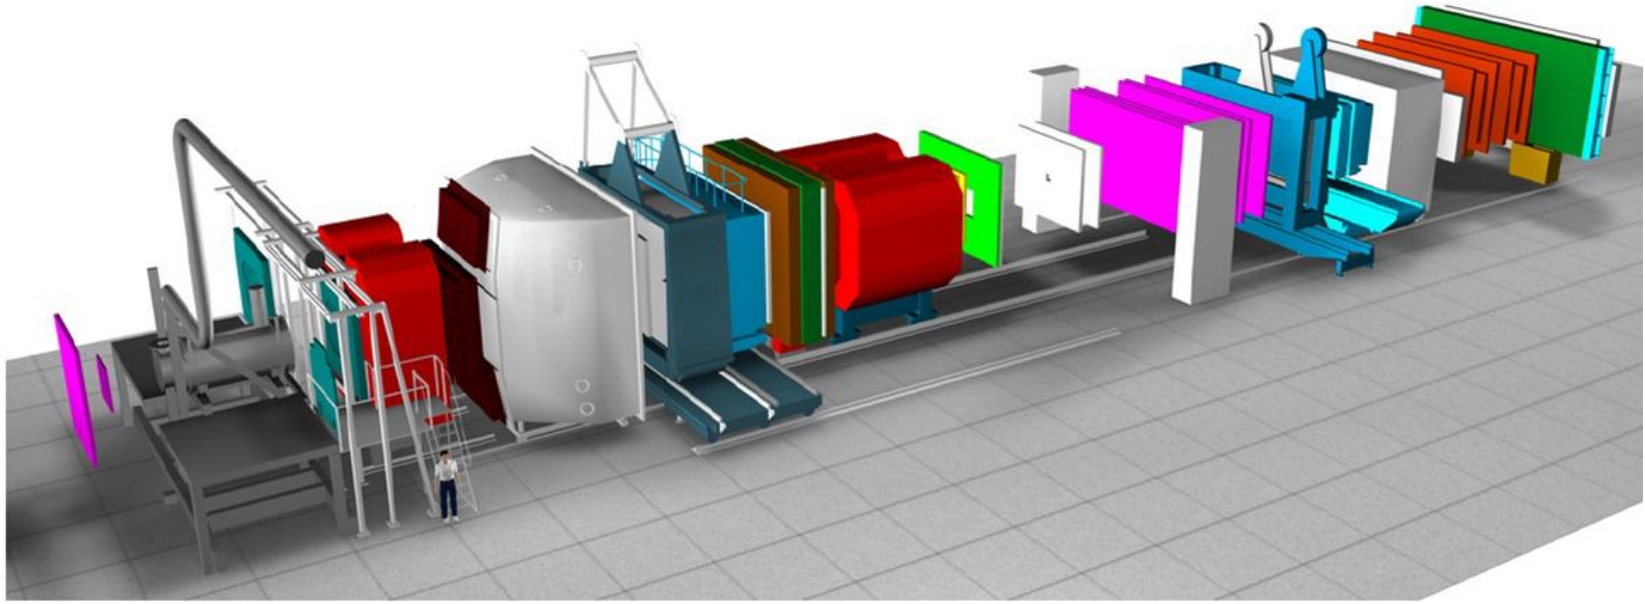
The $\pi_1(1600)$ in the different channels accessible to COMPASS

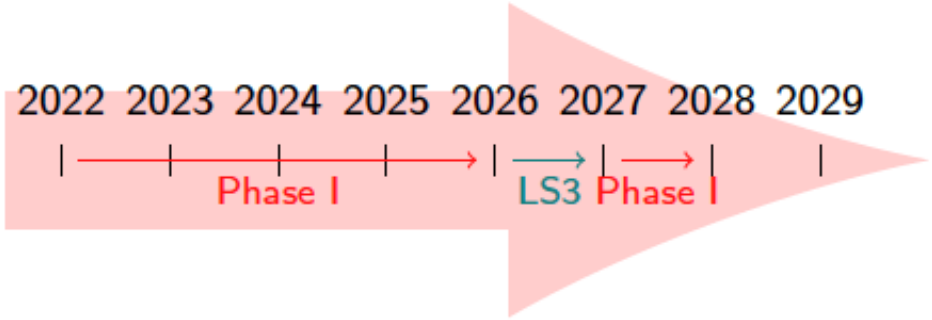


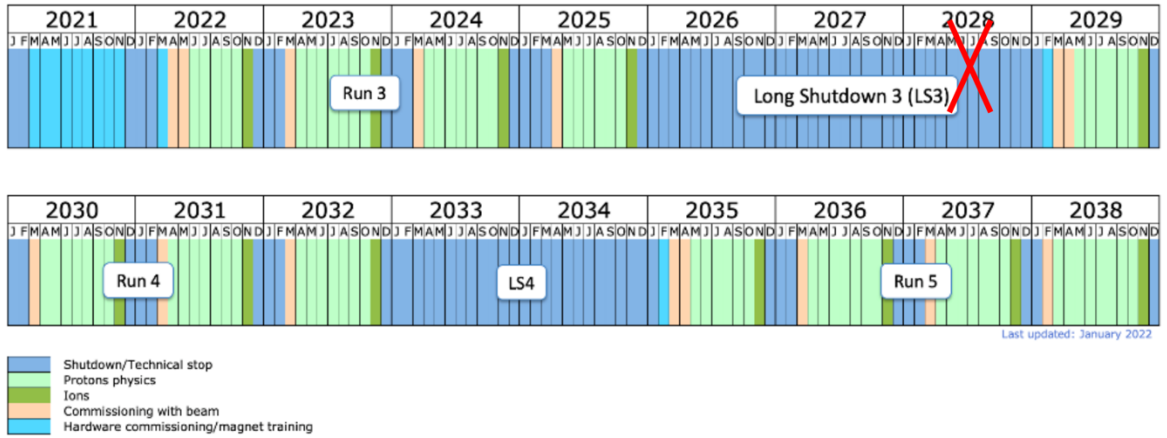
AMBER Collaboration and timelines

- Successor of COMPASS

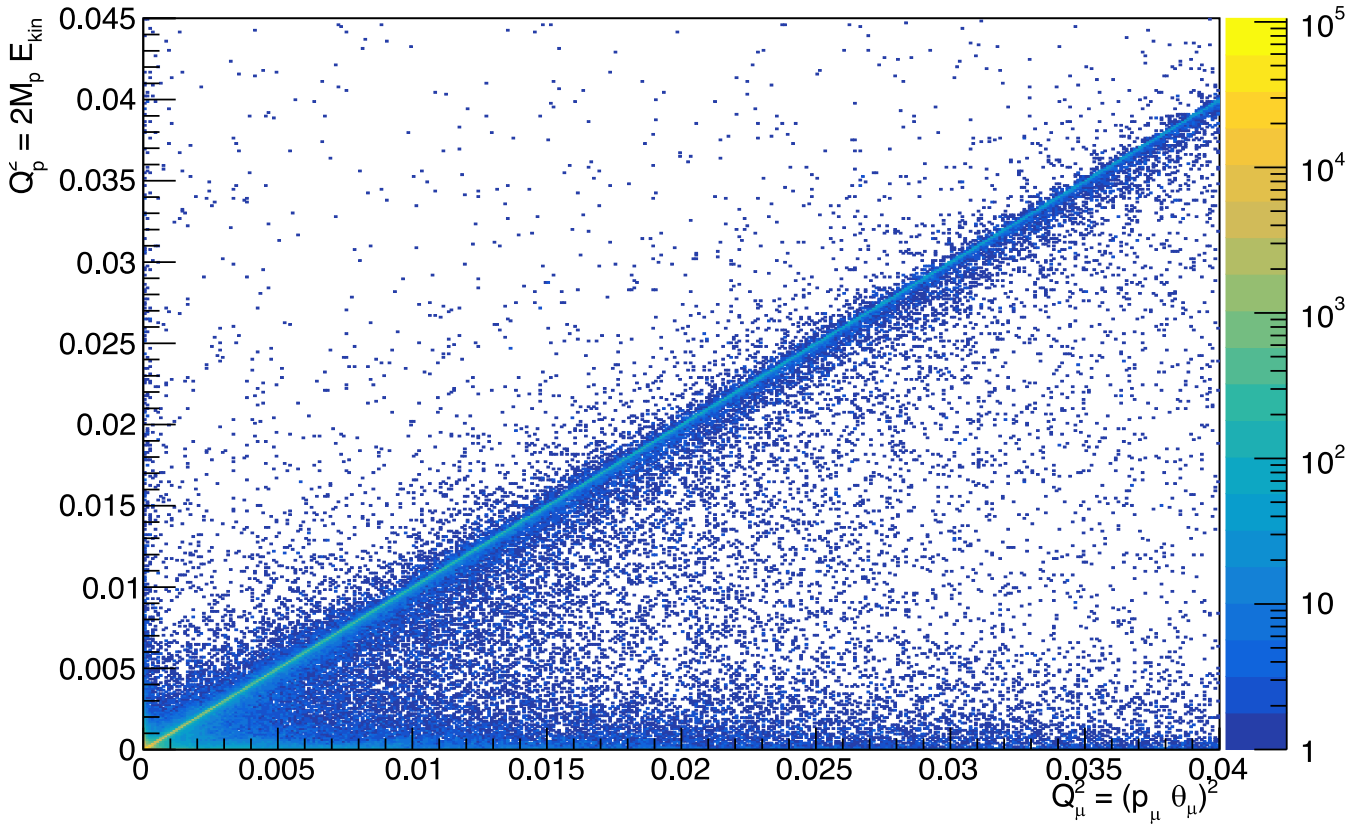
- with appropriate extensions and modernisations
- at the CERN M2 beamline
- ~200 physicists from ~34 institutes



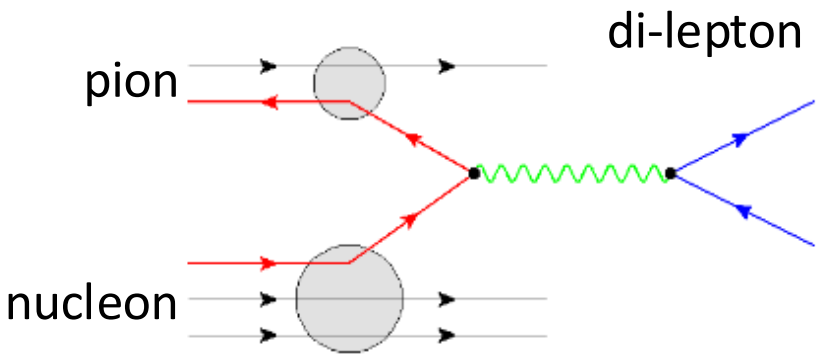


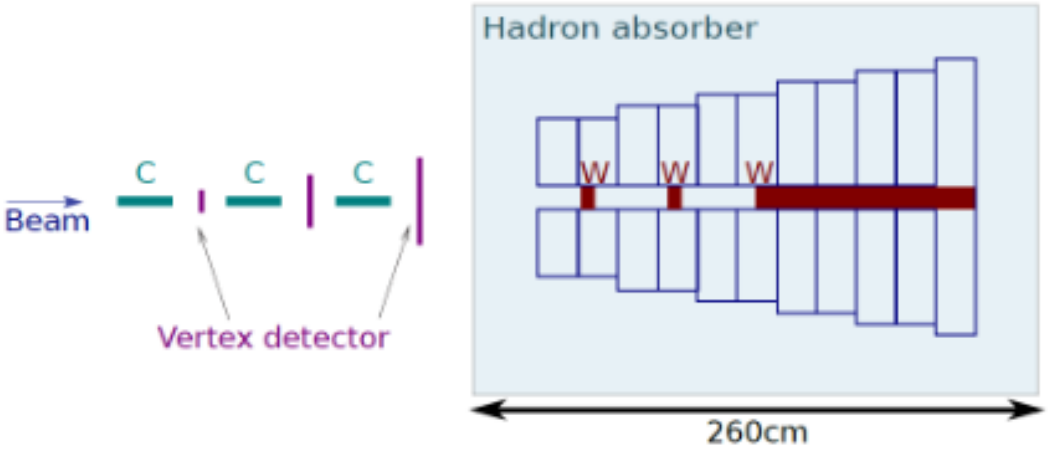


Impact of photon emission on the muon-proton correlation



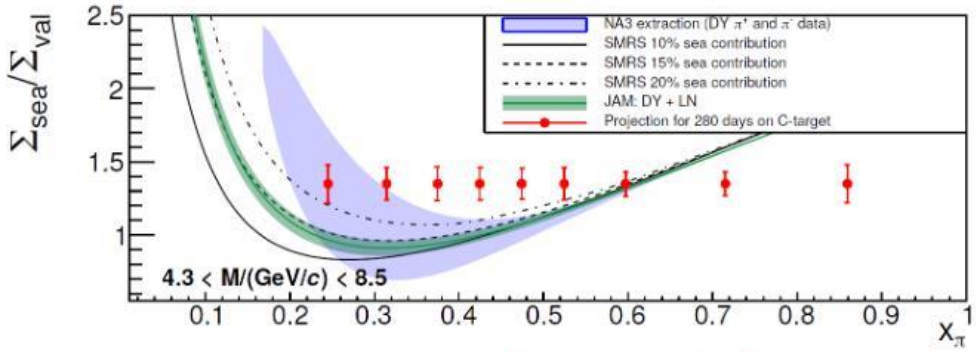
Drell-Yan and pion PDFs at AMBER





- Beams of positively and negatively charged pions to separate valence and sea contribution:

$$\frac{\Sigma_{\text{sea}}}{\Sigma_{\text{val}}} = \frac{4\sigma^{\pi^+C} - \sigma^{\pi^-C}}{-\sigma^{\pi^+C} + \sigma^{\pi^-C}}$$

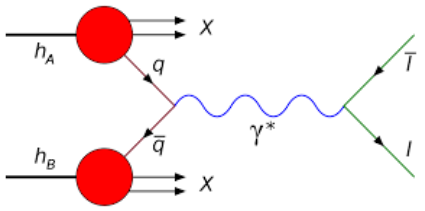


$$\sigma_{\text{DY}}^{\pi^+ A} \propto \sum_i (e_i)^2 \left[\bar{q}_i^{\pi^+} q_i^A + q_i^{\pi^+} \bar{q}_i^A\right]$$

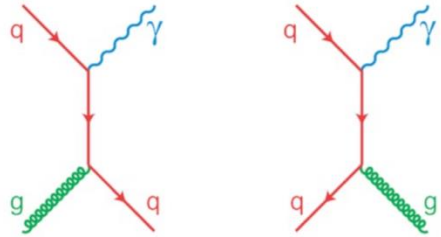
- 250k DY events expected (current available statistics 25k events)
- First precise and direct measurement of the sea quark distribution in the pion
- 190 GeV pion beam
- Di-muon mass resolution of 100 MeV

dedicated talk (M. Chiosso) in the *Nucleon Structure in DIS* parallel session

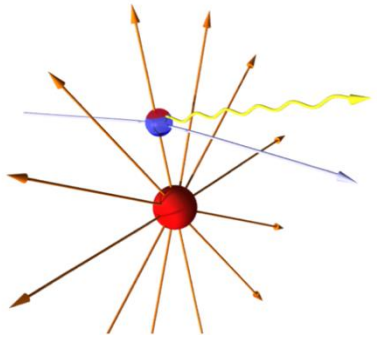
The ideas of the Phase-2 proposal



- Kaon structure via the Drell-Yan process

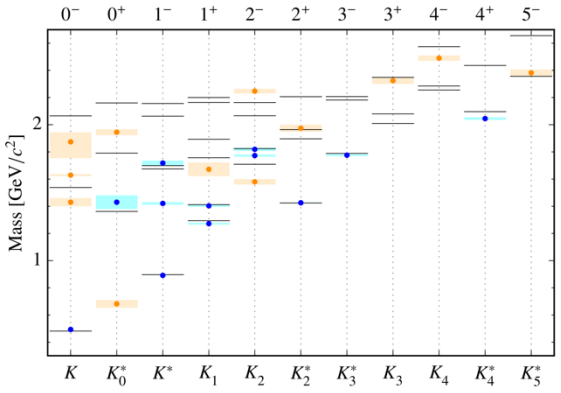


- Gluon structure of pions and kaons via prompt photons

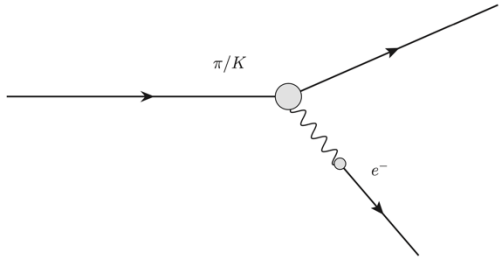


- Primakoff reactions to investigate kaon-photon coupling: kaon polarisability, $F_{KK\pi}$

- Generalized Parton Distributions in DVCS and HEMP



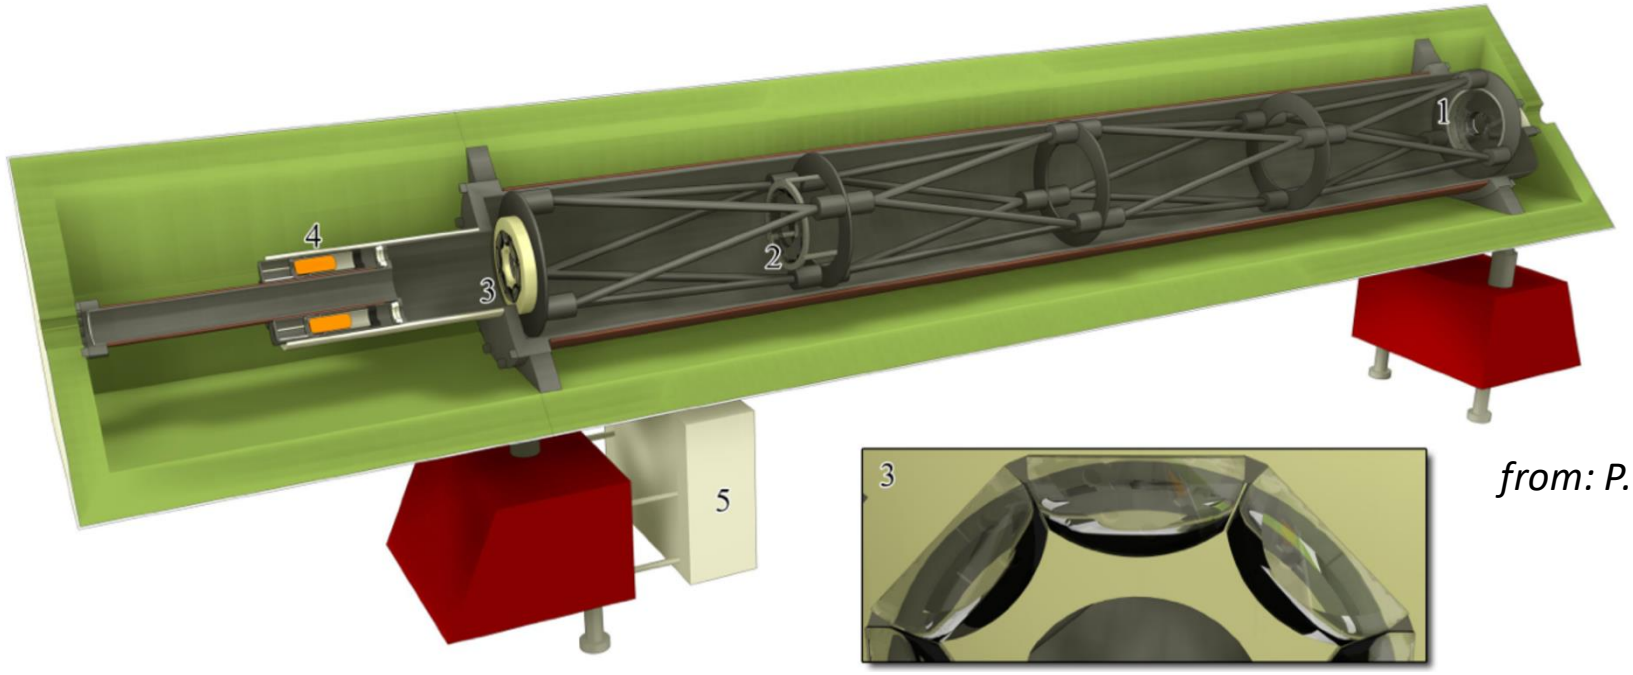
- Spectroscopy of mesons with strangeness



- Meson charge radii via electron scattering in inverse kinematics

- Diffractive production of vector mesons and di-jets to study distribution amplitudes

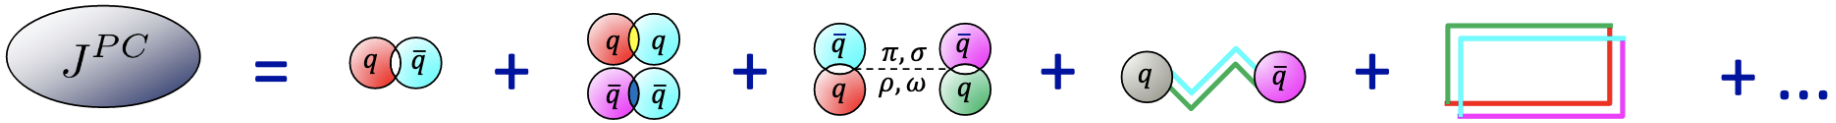
Beam PID by CEDARs



from: P. Jasinski, PhD thesis

- High-efficiency and high-purity beam particle identification is of key importance in all scenarios of hadron beams
- Optimum operation not only concerns mechanics and optics (temperature stabilization, photon detection), but as well parallelism of the incoming beam → material budget of the beamline

Exotic mesons



$(q\bar{q})_0$ $(qq)_8(\bar{q}\bar{q})_8$ $(q\bar{q})_0(q\bar{q})_0$ $(q\bar{q})_8 g$ $(gg)_0$

Tetraquark Molecule Hybrid Glueball

Where are they?

How to identify them?

- Spin-exotic: $J^{PC} = 0^{--}, 0^{+-}, 1^{-+}, \ldots$
- Supernumerary states
- Flavor-exotic: $|Q|, |I_3|, |S|, |C| \geq 2$
- Comparison with models, lattice

Need:

- Large data sets with small statistical uncertainties
- Complementary experiments
  - production mechanisms
  - final states
- Advanced analysis methods
  - reaction models
  - theoretical constraints

Limitations at COMPASS

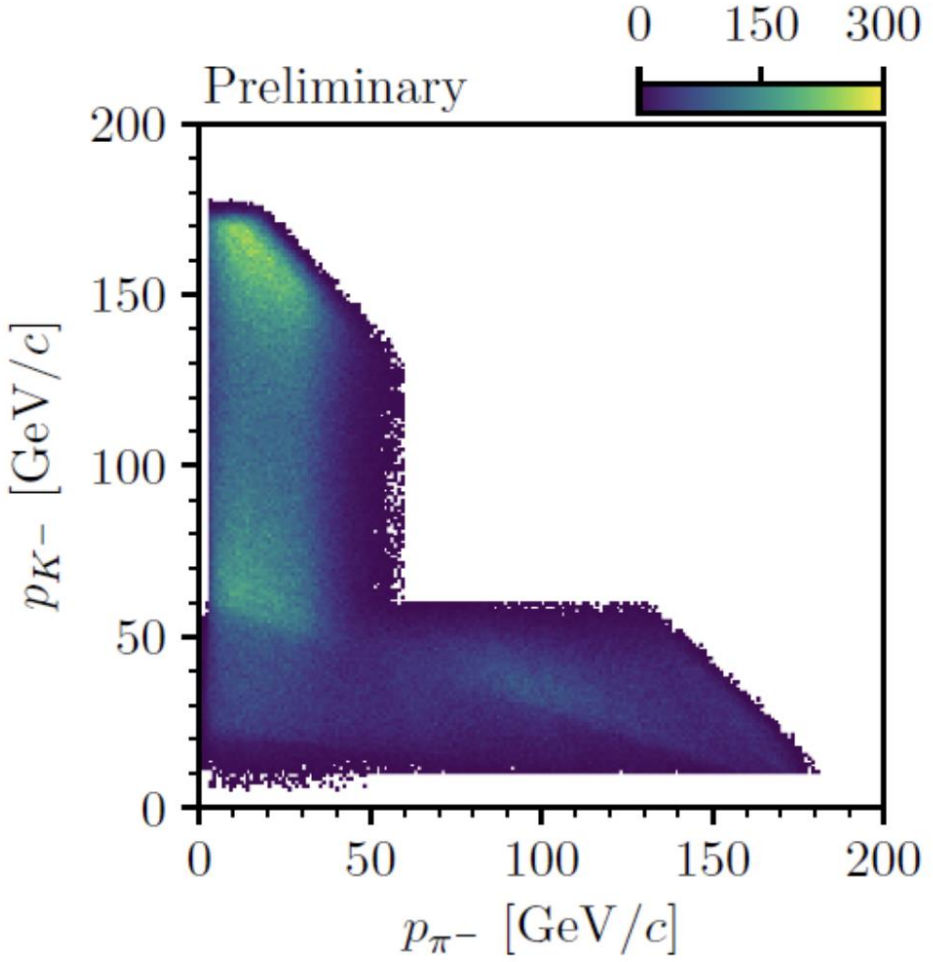
- Final-state particle identification does not cover full momentum range

Cannot identify the full final state

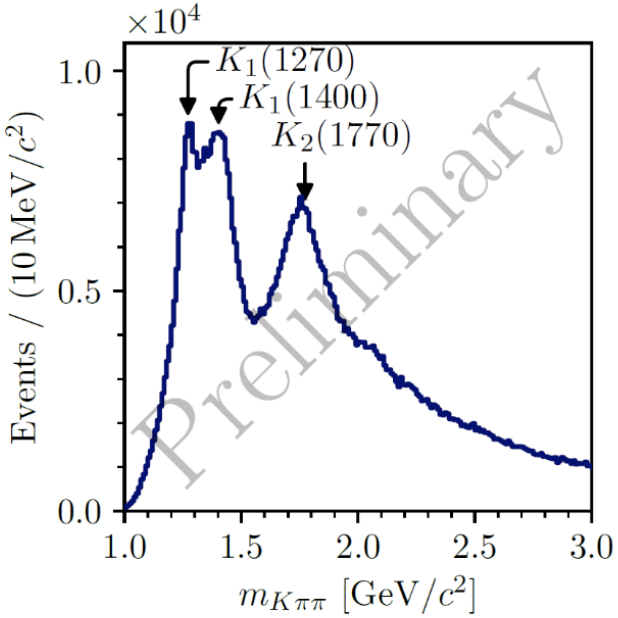
- Assume sample contains only $K^-\pi^-\pi^+$ events
  - Minimal PID: Need to know which of h^- is K^-
- Require only one of h^- to be identified
- Acceptance reduced by more than 1/3
- Almost no suppression of KKK, $\pi\pi\pi$, ...

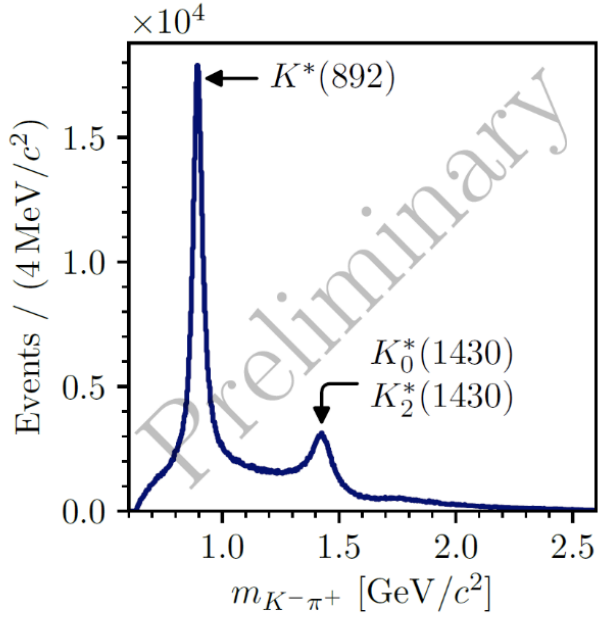
Blind spot in experimental acceptance

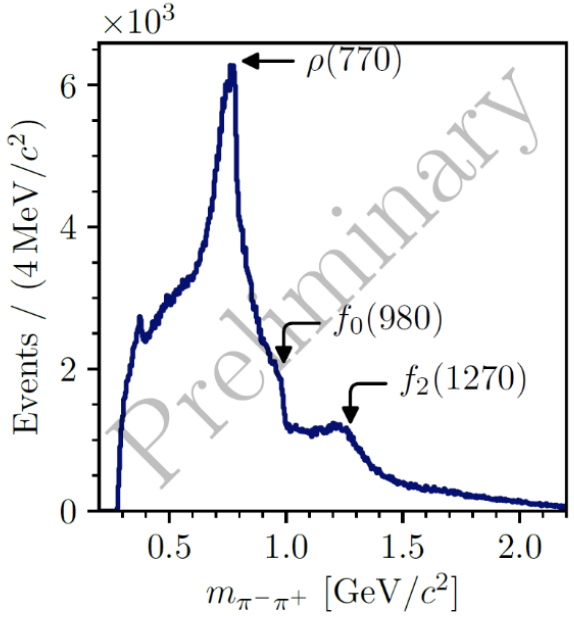
- Decay amplitudes of different J^P are orthogonal
- Loss of orthogonality taking acceptance into account



COMPASS: $K^- \pi^- \pi^+$







Study reaction $K^- + p \rightarrow K^-\pi^-\pi^+ + p$ by tagging beam kaons (2.4%)

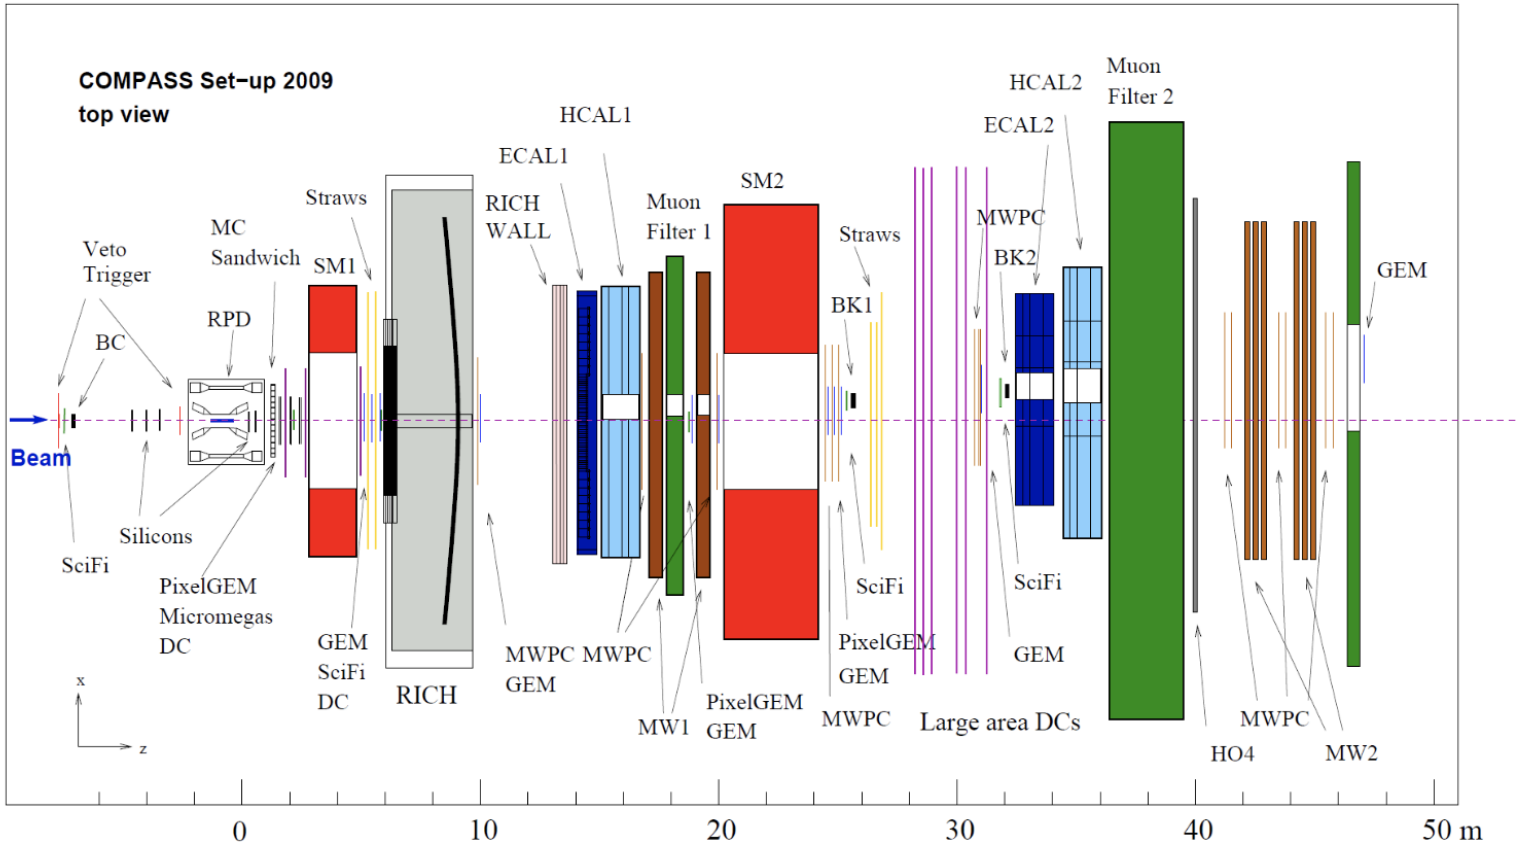
⇒ access to all kaon states: K_J, K_J^*

⇒ world's largest data set so far: 720 000 exclusive events (ACCMOR: 200k ev.)

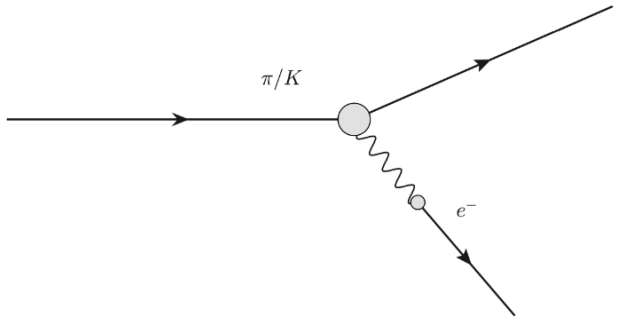
Goal for AMBER: collect $10 - 20 \times 10^6$ exclusive $K^-\pi^-\pi^+$ events

Setup for strange-meson spectroscopy

- hadron BMS
- CEDARs
- 2-stage spectrometer
- lH2 target
- RPD
- Si trackers
- ECAL 0, 1, 2
- RICH-0, RICH-1, RICH-2



Kinematics for different beam particles



$$K^- e^-_{target} \rightarrow K^- e^-$$

$$Q^2 \approx 2m_e \cdot E_e$$

$$s = 2E_b m_e + m_b^2 + m_e^2$$

$$Q^2_{max} = \frac{4 \cdot m_e^2 \cdot p_b^2}{s} = 4 \cdot p^2_{cm}$$

Beam	E_{beam} [GeV]	Q^2_{max} [GeV²]	$E^{min}_{scatter}(Q^2 \sim 10^{-4})$ [GeV]	$E^{electron}_{max}$ Q^2_{max} [GeV]	$E_e^{lab-equivalent}$ [GeV]
